

CSE 190, Winter 2015: Assignment 2

Instructions

This is an **open-ended** assignment in which you are expected to write a detailed report documenting your results. Please submit your solution in class or electronically to Long Jin (longjin@cs.ucsd.edu), on or before June 2 (last Tuesday of class). This assignment is worth **20%** of the final grade.

This assignment may be conducted **in groups of up to three**. The marking scheme is the same regardless of your group's size. Make sure to mention the names of all of your group members when submitting. Submissions should be in the form of a written report, which is expected to be at least four pages (double column, 11pt), or roughly 2.5-3 thousand words, plus figure, tables, and equations. See an example template in the lecture slides to get an idea of the length expected.

Examples of datasets and projects that may be of interest in this assignment were discussed in Lecture 11: http://cseweb.ucsd.edu/~jmcauley/cse190/slides/lecture11_assignment2.pdf

Tasks

Assignments will be graded based on their coverage of the following four components. Examples of what might be included in these sections is described in the above link. Each of the four sections below will contribute approximately 5 percent of your grade, for a total of 20 percent for the whole assignment.

1. Identify a **dataset** to study, and perform an exploratory analysis of the data. Describe the dataset, including its basic statistics and properties, and report any interesting findings. This exploratory analysis should motivate the design of your model in the following sections. Datasets should be reasonably large (e.g. more than 50,000 samples).
2. Identify a **predictive task** that can be studied on this dataset. Describe how you will evaluate your model at this predictive task, what relevant baselines can be used for comparison, and how you will assess the validity of your model's predictions. It's fine to use models that were described in class here (i.e., you don't have to invent anything new (though you may!)), though you should explain and justify which model was appropriate for the task. It's also important in this section to carefully describe what features you will use and how you had to process the data to obtain them.
3. Describe **literature** related to the problem you are studying. If you are using an existing dataset, where did it come from and how was it used? What other similar datasets have been studied in the past and how? What are the state-of-the-art methods currently employed to study this type of data? Are the conclusions from existing work similar to or different from your own findings?
4. Describe your **Results** and conclusions. How well does your model perform compared to alternatives, and what is the significance of the results? Which feature representations work well and which do not? What is the interpretation of your model's parameters? Why did the proposed model succeed why others failed (or if it failed, why did it fail)?
