# Today's learning goals

Sipser Section 1.1

- Design an automaton that recognizes a given language.
- Specify each of the components in a formal definition of an automaton.
- Prove that an automaton recognizes a specific language.

# Specifying an automaton

(  $\{q_1, q_2, q_3\}$ ,  $\{a, b\}$ ,  $\delta$ ,  $q_1$ , ? )

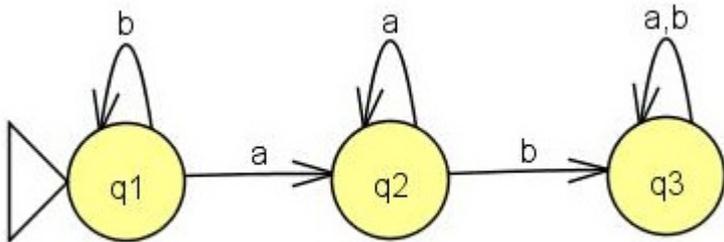

What state(s) should be in  $F$  so that the language of this machine is  
 $\{ w \mid ab \text{ is a substring of } w \}$ ?

- A.  $\{q_2\}$
- B.  $\{q_3\}$
- C.  $\{q_1, q_2\}$
- D.  $\{q_1, q_3\}$
- E. I don't know.

# Specifying an automaton

(  $\{q_1, q_2, q_3\}$ ,  $\{a, b\}$ ,  $\delta$ ,  $q_1$ , ? )

What state(s) should be in  $F$  so that the language of this machine is  $\{ w \mid \text{b's never occur after a's in } w \}$ ?

- A.  $\{q_2\}$
- B.  $\{q_3\}$
- C.  $\{q_1, q_2\}$
- D.  $\{q_1, q_3\}$
- E. I don't know.

# Building DFA

## Typical questions

Define a DFA which recognizes the given language  $L$ .

*or*

Prove that the (given) language  $L$  is regular.

# Building DFA

## Example

Define a DFA which recognizes

$\{ w \mid w \text{ has at least 2 a's} \}$

# Building DFA

## Example

Define a DFA which recognizes

$\{ w \mid w \text{ has at most 2 a's} \}$

# Building DFA

## Remember

States are our only (computer) memory.

Design and pick states with specific roles / tasks in mind.

*"Have not seen any of desired pattern yet"*

*"Trap state"*

# Justification?

To prove that the DFA we build,  $M$ , actually recognizes the language  $L$

$$\text{WTS } L(M) = L$$

(1) Is every string accepted by  $M$  in  $L$ ?

(2) Is every string from  $L$  accepted by  $M$ ?

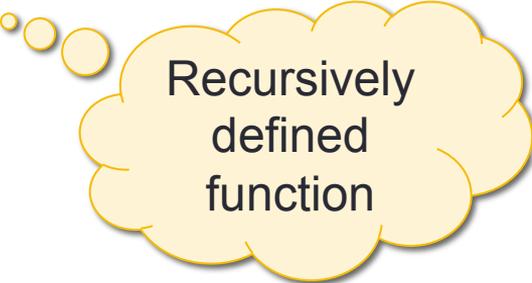

*or contrapositive version: Is every string rejected by  $M$  not in  $L$ .*

# A useful (optional) bit of terminology

When is a string accepted by a DFA?

**Computation of M on w:** *where do we land when start at  $q_0$  and read each symbol of w one-at-a time?*

$$\delta^*(q, w) =$$

Recursively  
defined  
function

# Regular languages

Sipser p. 35 Def 1.5

- DFA  $M$  over the alphabet  $\Sigma$ 
  - For each string  $w$  over  $\Sigma$ ,  $M$  either accepts  $w$  or rejects  $w$
  - The **language recognized by  $M$**  is the set of strings  $M$  accepts
  - The **language of  $M$**  is the set of strings  $M$  accepts
  - **$L(M)$**  = {  $w$  |  $w$  is a string over  $\Sigma$  and  $M$  accepts  $w$  }

A language is **regular** iff there is some finite automaton that recognizes **exactly** it.

# Regular languages: bounds?

Is **every** finite language regular?

- A. No: some finite languages are regular, and some are not.
- B. No: there are no finite regular languages.
- C. Yes: every finite language is regular.
- D. I don't know.

# Building DFA

## Remember

States are our only (computer) memory.

Design and pick states with specific roles / tasks in mind.

*"Have not seen any of desired pattern yet"*

*"Trap state"*

# Building DFA

## New strategy

Express  $L$  in terms of simpler languages – use them as building blocks.

### Example

$L = \{ w \mid w \text{ does not contain the substring baba} \}$   
= the complement of the set  
 $\{w \mid w \text{ contains the substring baba}\}$

# Building DFA

DFA recognizing

$\{w \mid w \text{ contains the substring baba}\}$

DFA recognizing

$\{w \mid w \text{ doesn't contain the substring baba}\}$

# Complementation

**Claim:** If  $A$  is a regular language over  $\{0,1\}^*$ , then so is  $\overline{A}$

aka "the class of regular languages is closed under complementation"

# Complementation

**Claim:** If  $A$  is a regular language over  $\{0,1\}^*$ , then so is  $\overline{A}$   
**aka "the class of regular languages is closed under complementation"**

Proof: Let  $A$  be a regular language. Then there is a DFA  $M=(Q,\Sigma,\delta,q_0,F)$  such that  $L(M) = A$ . We want to build a DFA whose language is  $\overline{A}$ . Define

$M' =$

*Claim of Correctness*  $L(M') = \overline{A}$

*Proof of claim...*

# Why closure proofs?

- General technique of proving a new language is regular
- Stretch the power of the model
- Puzzle!

# Set operations

Input set(s)  $\rightarrow$  OPERATION  $\rightarrow$  Output set

Complementation

Kleene star

Concatenation

Union

Intersection

Set difference

# The regular operations

Sipser Def 1.23 p. 44

For  $A, B$  languages over same alphabet, define:

$$A \cup B = \{x \mid x \in A \text{ or } x \in B\}$$

$$A \circ B = \{xy \mid x \in A \text{ and } y \in B\}$$

$$A^* = \{x_1x_2 \dots x_k \mid k \geq 0 \text{ and each } x_i \in A\}$$

**These are operations on sets!**

# Union

Sipser Theorem 1.25 p. 45

**Theorem:** The class of regular languages over fixed alphabet  $\Sigma$  is closed under the union operation.

Proof:

What are we proving here?

- A. For any set  $A$ , if  $A$  is regular then so is  $A \cup A$ .
- B. For any sets  $A$  and  $B$ , if  $A \cup B$  is regular, then so is  $A$ .
- C. For two DFAs  $M_1$  and  $M_2$ ,  $M_1 \cup M_2$  is regular.
- D. None of the above.
- E. I don't know.

# Union

Sipser Theorem 1.25 p. 45

**Theorem:** The class of regular languages over fixed alphabet  $\Sigma$  is closed under the union operation.

Proof: Let  $A_1, A_2$  be any two regular languages over  $\Sigma$ .

**WTS** that  $A_1 \cup A_2$  is regular.

**Goal:** build a machine that recognizes  $A_1 \cup A_2$ .

# For next time

- Finish Individual Homework 0 **due Saturday**
- Review quiz 1 **due Sunday** (for credit)
- Read Individual Homework 1 **due Tuesday**

Pre class-reading for Wednesday:

Theorem 1.25, Theorem 1.26
