What can stop US Postal Service trucks? The inexorable march of time

The ageing fleet of delivery vehicles is long past due an overhaul. Among the common-sense upgrades employees want: air conditioning and more workspace.

For the better part of the last 30 years, the flatulent buzz of the US Postal Service's boxy delivery vans - audible as they lighted from mailbox to mailbox - has been a familiar sound to most Americans. Neither snow nor rain nor heat nor gloom of night stays the USPS's mail trucks from the swift completion of their appointed rounds.

Neither snow nor rain nor heat nor gloom of night stays these trucks - but time, it turns out, will. Photograph: Bill Sikes/AP
Apple Is Forming an Auto Team

By BRIAN X. CHAN and MIKE ISAAC    FEB 19, 2016

SAN FRANCISCO — While Apple has been preparing to release its first wearable computers, the company has also been busy assembling a team to work on an automobile.

The company has collected about 200 people over the last few years — both from inside Apple and potential competitors like Tesla — to develop technologies for an electric car, according to two people with knowledge of the company’s plans, who asked not to be named because the plans were private.

The car project is still in its prototype phase, one person said, meaning it is probably many years away from being a viable product and might never reach the mass market if the quality of the vehicle fails to impress Apple’s executives.

It could also go nowhere if Apple struggles to find a compelling business opportunity in automobiles, a business that typically has much lower sales margins than

Meatloaf That Conquers the Mundane

I was raised on Midwestern meatloaf. My mother’s dependable recipe did not vary: Ground beef, grated onion and carrot and a little oatmeal were the main ingredients, along with a dash of “seasoned salt.” A ribbon of bottled chili sauce ran down a gully in the center.

Served hot, accompanied by Tater Tots, it was dinner. Served cold for lunch, it was always a sandwich on white bread, with potato chips on the side. It was usually moist and tasty but never remarkable, and there was no way you could call it anything but meatloaf.

Do I harbor a kind of nostalgia for it? Yes. But would I use that recipe now? I think not.

I have a friend from Brussels who loves to entertain. Of his dinner party repertoire, one dish is most requested and admired. It is pain de veau, served with a vermouth-splashed mushroom sauce. In French, it sounds elegant. Translated into English — veal loaf — it sounds dull.

The Italian word for meatloaf is polpettone. (Polpette are Italian meatballs; polpatte are meatballs, too, but more diminutive.) This substantial family-size meatball, whether ovoid or elongated, plain or fancy, served with tomato sauce or not, is beloved both in Italy and in Italian communities throughout the world. Aside from its melodic, polysyllabic name, polpettone is always well seasoned, prepared with care and served with gusto.

It is usually a combination of different kinds of ground meat, typically beef, pork and veal in equal parts. Grated cheese and herbs are

🌟🌟🌟🌟🌟 Le Creuset on a budget
By N. Laford on October 24, 2007
Color Name: Caribbean Blue | Size Name: 6 qt | Verified Purchase
Enamel on cast iron cookware like this, was, until recently, only available from makers like Le Creuset. Lately, several lower cost makers have come on the scene, like Target and Innova. The new budget priced Lodge cookware is in the same price range as the low cost alternatives but completely out performs them.

I have all of the brands I have mentioned. The Lodge is the same weight as the Le Creuset which is much heavier than the other budget models. The ridge where the lid and sides meet is a matt black porcelain on the Lodge and Le Creuset but is just exposed cast iron for the other budget models (which leads to rusting if you are not careful). The porcelain resists staining (even tomato sauces) in the Lodge and Le Creuset but the other budget models stain very easily. And finally, the Lodge and Le Creuset maintain a very polished interior finish that resists sticking which others do not. So, I see no performance differences at all between the Le Creuset and the Lodge whereas the comparably priced budget models are certainly inferior.

If you plan of using these pots very heavily (every day for example) you might want to upgrade to the higher priced Lodge product. It has 4 coatings of enamel as opposed to 2 in this model. But if you use them once or twice a week I dont think you will need the added wear resistance.

🌟🌟🌟🌟🌟 OK pot, Great Price. Some flaws.
By J. G. Pavlovich on March 2, 2008
Color Name: Island Spice Red | Size Name: 0 qt | Verified Purchase
This is a terrific value. The quality and performance match my Le Creuset pieces at a fraction of the price. The only slight design flaw I have found is that the rounded bottom makes browning large pieces of meat awkward. Other than that I have no complaints. Even heating. Easy clean up. I use it several times a week.
UPDATE: I found a second minor problem. The inside rim of the lid has a couple of raised spots which prevent the lid from seating tightly. This causes steam to escape much faster than I would like during a long braise or stew.

Update 2: Three years in I am dropping my rating to three stars. It's still a decent pot at a bargain price, but it will not be an heirloom piece like my Le Creuset. The loose fitting lid turns...

Which of these sentences best summarizes people’s opinions?

Customer Reviews

Easy to clean, beautiful color.
Howard R. Cohen

Have made spaghetti sauce, beef stew, chicken stew, vegetable soup, pot roast....all kinds of things.
J. L. Knox

I love my dutch oven, use it all the time....so I bought one for my mother, and she is really enjoying it too!
juli scott
Which sentences refer to which aspect of the product?

‘Partridge in a Pear Tree’, brewed by ‘The Bruery’

Dark brown with a light tan head, minimal lace and low retention. Excellent aroma of dark fruit, plum, raisin and red grape with light vanilla, oak, caramel and toffee. Medium thick body with low carbonation. Flavor has strong brown sugar and molasses from the start over bready yeast and a dark fruit and plum finish. Minimal alcohol presence. Actually, this is a nice quad.

Feel: 4.5  Look: 4  Smell: 4.5  Taste: 4  Overall: 4
Today

Using **text** to solve predictive tasks

- How to represent **documents** using **features**?
- Is text **structured** or **unstructured**?
- Does structure actually help us?
- How to account for the fact that most words may not convey much information?
- How can we find **low-dimensional** structure in text?
We’d like a fixed-dimensional representation of documents, i.e., we’d like to describe them using feature vectors.

This will allow us to compare documents, and associate weights with particular features to solve predictive tasks etc. (i.e., the kind of things we’ve been doing every week.)
Feature vectors from text

**Option 1:** just count how many times each word appears in each document

The Peculiar Genius of Bjork

Solo musician or master collaborator? For her new album, Bjork has merged the two sides of her artistry to create a new experience of music — again.

F_{text} = [150, 0, 0, 0, 0, 0, 0, ... , 0]

a, aardvark, zoetrope
Feature vectors from text

- Yeast and minimal red body thick light a Flavor sugar strong quad. grape over is molasses lace the low and caramel fruit Minimal start and toffee. dark plum, dark brown Actually, alcohol Dark oak, nice vanilla, has brown of a with presence. light carbonation. bready from retention. with finish. with and this and plum and head, fruit, low a Excellent raisin aroma Medium tan

These two documents have **exactly** the same representation in this model, i.e., we’re completely **ignoring** syntax. This is called a “bag-of-words” model.
Option 1: just count how many times each word appears in each document

We’ve already seen some (potential) problems with this type of representation in week 3 (dimensionality reduction), but let’s see what we can do to get it working
Feature vectors from text

50,000 reviews are available on:
http://jmcauley.ucsd.edu/cse190/data/beer/beer_50000.json
(see course webpage, from week 1)

Code on:
http://jmcauley.ucsd.edu/cse190/code/week6.py
Q1: How many words are there?

```python
wordCount = defaultdict(int)
for d in data:
    for w in d['review/text'].split():
        wordCount[w] += 1

print len(wordCount)
```

**A:** 150,009 (too many!)
2: What if we remove capitalization/punctuation?

```python
wordCount = defaultdict(int)
punctuation = set(string.punctuation)
for d in data:
    for w in d['review/text'].split():
        w = ''.join([c for c in w.lower() if not c in punctuation])
        wordCount[w] += 1
print len(wordCount)
```

A: 74,271 (still too many!)
3: What if we merge different inflections of words?

- drinks → drink
- drinking → drink
- drinker → drink

- argue → argu
- arguing → argu
- argues → argu
- arguing → argu
- argus → argu
3: What if we merge different inflections of words?

This process is called “stemming”

- The first stemmer was created by Julie Beth Lovins (in 1968!!)
- The most popular stemmer was created by Martin Porter in 1980
3: What if we merge different inflections of words?

The algorithm is (fairly) simple but depends on a huge number of rules

3: What if we merge different inflections of words?

```python
wordCount = defaultdict(int)
punctuation = set(string.punctuation)
stemmer = nltk.stem.porter.PorterStemmer()
for d in data:
    for w in d['review/text'].split():
        w = ''.join([c for c in w.lower() if not c in punctuation])
        w = stemmer.stem(w)
        wordCount[w] += 1

print len(wordCount)
```

A: 59,531 (still too many...
3: What if we merge different inflections of words?

- Stemming is **critical** for retrieval-type applications (e.g. we want Google to return pages with the word “cat” when we search for “cats”)
- Personally I tend not to use it for predictive tasks. Words like “waste” and “wasted” may have different meanings (in beer reviews), and we’re throwing that away by stemming
Feature vectors from text

4: Just discard extremely rare words...

counts = [(wordCount[w], w) for w in wordCount]
counts.sort()
counts.reverse()

words = [x[1] for x in counts[:1000]]

• Pretty unsatisfying but at least we can get to some inference now!
Let’s do some inference!

**Problem 1: Sentiment analysis**

Let’s build a predictor of the form:

\[ f(\text{text}) \rightarrow \text{rating} \]

using a model based on linear regression:

\[ \text{rating} \approx \alpha + \sum_{w \in \text{text}} \text{count}(w) \cdot \theta_w \]

Code: [http://jmcauley.ucsd.edu/cse190/code/week6.py](http://jmcauley.ucsd.edu/cse190/code/week6.py)
What do the parameters look like?

\[ \theta_{\text{fantastic}} = 0.143 \]
\[ \theta_{\text{watery}} = -0.163 \]
\[ \theta_{\text{and}} = -0.008 \]
\[ \theta_{\text{me}} = -0.037 \]
Feature vectors from text

Why might parameters associated with “and”, “of”, etc. have non-zero values?

• Maybe they have meaning, in that they might frequently appear slightly more often in positive/negative phrases
• Or maybe we’re just measuring the length of the review...

How to fix this (and is it a problem)?
1) Add the length of the review to our feature vector
2) Remove stopwords
Feature vectors from text

Removing stopwords:

```python
from nltk.corpus import stopwords
stopwords.words("english")
```

['i', 'me', 'my', 'myself', 'we', 'our', 'ours', 'ourselves', 'you',
'your', 'yours', 'yourself', 'yourselves', 'he', 'him', 'his', 'himself',
she', 'her', 'hers', 'herself', 'it', 'its', 'itself', 'they', 'them',
'their', 'theirs', 'themselves', 'what', 'which', 'who', 'whom', 'this',
'that', 'these', 'those', 'am', 'is', 'are', 'was', 'were', 'be', 'been',
'being', 'have', 'has', 'had', 'having', 'do', 'does', 'did', 'doing',
a', 'an', 'the', 'and', 'but', 'if', 'or', 'because', 'as', 'until',
'while', 'of', 'at', 'by', 'for', 'with', 'about', 'against', 'between',
'into', 'through', 'during', 'before', 'after', 'above', 'below', 'to',
'from', 'up', 'down', 'in', 'out', 'on', 'off', 'over', 'under', 'again',
'further', 'then', 'once', 'here', 'there', 'when', 'where', 'why',
'how', 'all', 'any', 'both', 'each', 'few', 'more', 'most', 'other',
some', 'such', 'no', 'nor', 'not', 'only', 'own', 'same', 'so', 'than',
too', 'very', 's', 't', 'can', 'will', 'just', 'don', 'should', 'now']
Feature vectors from text

Why remove stopwords?

some (potentially inconsistent) reasons:
• They convey little information, but are a substantial fraction of the corpus, so we can reduce our corpus size by ignoring them.
• They **do** convey information, but only by being correlated by a feature that we don’t want in our model.
• They make it more difficult to reason about which features are informative (e.g. they might make a model harder to visualize).
• We’re confounding their importance with that of phrases they appear in (e.g. words like “The Matrix”, “The Dark Night”, “The Hobbit” might predict that an article is about movies).

so use n-grams!
We can build a richer predictor by using **n-grams**

e.g. “Medium thick body with low carbonation.”

**unigrams:** [“medium”, “thick”, “body”, “with”, “low”, “carbonation”]

**bigrams:** [“medium thick”, “thick body”, “body with”, “with low”, “low carbonation”]

**trigrams:** [“medium thick body”, “thick body with”, “body with low”, “with low carbonation”]

etc.
We can build a richer predictor by using n-grams

• Fixes some of the issues associated with using a bag-of-words model – namely we recover some basic syntax – e.g. “good” and “not good” will have different weights associated with them in a sentiment model
• Increases the dictionary size by a lot, and increases the sparsity in the dictionary even further
• We might end up double (or triple-) counting some features (e.g. we’ll predict that “Adam Sandler”, “Adam”, and “Sandler” are associated with negative ratings, even though they’re all referring to the same concept)
We can build a richer predictor by using n-grams

• This last problem (that of double counting) is bigger than it seems: We’re massively increasing the number of features, but possibly increasing the number of informative features only slightly

• So, for a fixed-length representation (e.g. 1000 most-common words vs. 1000 most-common words+bigrams) the bigram model will quite possibly perform worse than the unigram model

(homework exercise? – I don’t know the outcome!)
Feature vectors from text

Other prediction tasks:

**Problem 2: Multiclass classification**

Let’s build a predictor of the form:

\[ f(\text{text}) \rightarrow \text{class label} \]

(or even \( f(\text{text}) \rightarrow \{1 \text{ star, 2 star, 3 star, 4 star, 5 star}\})

using a probabilistic classifier:

\[ p(\text{class} = c|\text{text}) \]
Recall: multinomial distributions

Want:

$$\sum_c p(\text{class} = c|\text{text}) = 1$$

When there were two classes, we used a sigmoid function to ensure that probabilities would sum to 1:

$$p(\text{label}|x) = \frac{1}{1+\exp(-\langle x, \theta \rangle)} \quad p(\neg \text{label}|x) = \frac{\exp(-\langle x, \theta \rangle)}{1+\exp(-\langle x, \theta \rangle)}$$
Recall: multinomial distributions

With many classes, we can use the same idea, by exponentiating linear predictors and normalizing:

\[ p(\text{class} = c | x) = \frac{1}{Z} \exp \langle \theta_c, x \rangle = \frac{\exp \langle \theta_c, x \rangle}{\sum_{c'} \exp \langle \theta_{c'}, x \rangle} \]

Each class has its own set of parameters

We can optimize this model exactly as we did for logistic regression, i.e., by computing the (log) likelihood and fitting parameters to maximize it.
Feature vectors from text

How to apply this to text classification?

\[ p(\text{class} = c | x) = \frac{1}{Z} \exp \langle \theta_c, x \rangle = \frac{\exp \langle \theta_c, x \rangle}{\sum_{c'} \exp \langle \theta_{c'}, x \rangle} \]

\[ \langle \theta_c, x \rangle = \theta_{c,0} + \sum_{w \in \text{text}} \text{count}(w) \cdot \theta_{c,w} \]

Background probability of this class

Score associated with the word \( w \) appearing in the class \( c \)
Feature vectors from text

\( \theta_{c,w} \) is now a "descriptor" of each category, with high weights for words that are likely to appear in the category.

**high weights:** \( \theta_{5\text{-}star, 'great'}, \theta_{5\text{-}star, 'fantastic'}, \theta_{1\text{-}star, 'terrible'} \)

**low weights:** \( \theta_{1\text{-}star, 'great'}, \theta_{1\text{-}star, 'fantastic'}, \theta_{5\text{-}star, 'terrible'} \)
So far...

Bags-of-words representations of text

- Stemming & stopwords
- Unigrams & N-grams
- Sentiment analysis & text classification
