Computer Graphics
CSE 167 [Win 19], Lecture 6: OpenGL 1
Ravi Ramamoorthi
http://viscomp.ucsd.edu/classes/cse167/w19

To Do
- HW 2 (much) more difficult than HW 1
  - Will cover all needed material mostly Tue next week
  - START EARLY (this weekend itself)
  - Milestone (can do immediately) due on Feb 4

Demo: Surreal (now 15+ years ago)

This Lecture
- Introduction to OpenGL and simple demo code
  - mytest1.cpp; you compiled mytest3.cpp for HW 0
  - Include skeleton code on all platforms for programs
- I am going to show (maybe write) actual code
  - Online code helps you understand HW 2 better
  - ASK QUESTIONS if confused!!
- Simple demo of mytest1 (and maybe hw2)
- This lecture deals with very basic OpenGL setup. Next 2 lectures will likely be more interesting

Outline
- Basic idea about OpenGL
- Basic setup and buffers
- Matrix modes
- Window system interaction and callbacks
- Drawing basic OpenGL primitives
- Initializing Shaders
  - Best source for OpenGL is the redbook. Of course, this is more a reference manual than a textbook, and you are better off implementing rather than reading end to end.
Introduction to OpenGL

- **OpenGL** is a graphics API
  - Portable software library (platform-independent)
  - Layer between programmer and graphics hardware
  - Uniform instruction set (hides different capabilities)
- OpenGL can fit in many places
  - Between application and graphics system
  - Between higher level API and graphics system
- Why do we need OpenGL or an API?
  - Encapsulates many basic functions of 2D/3D graphics
  - Think of it as high-level language (C++) for graphics
  - History: Introduced SGI in 92, maintained by Khronos
  - Precursor for DirectX, WebGL, Java3D etc.

OpenGL Rendering Pipeline (simple)

Traditional Approach: Fixed function pipeline (state machine)
New Development (2003-): Programmable pipeline

Full OpenGL Pipeline

User/program generates original vertices, textures
We cover programmable vertex and fragment shaders in course
OpenGL primitive setup, clipping, rasterization not programmable
Tessellation shaders take patches (splines) to output vertices
Geometry shaders process primitives, can add/remove geometry

Programmer’s View

GPUs and Programmability

- Since 2003, can write vertex/pixel shaders
- *Older fixed function pipeline deprecated, not taught*
- Like writing C programs (see OpenGL book)
- Performance >> CPU (even used for non-graphics)
- Operate in parallel on all vertices or fragments

- Are teaching CSE 167 with programmable shaders
  - And modern OpenGL (3.1+) and GLSL 330+!

Outline

- Basic idea about OpenGL
- Basic setup and buffers
- Matrix modes
- Window system interaction and callbacks
- Drawing basic OpenGL primitives
- Initializing Shaders
Buffers and Window Interactions

- Buffers: Color (front, back, left, right), depth (z), accumulation, stencil. When you draw, you write to some buffer (most simply, front and depth)
- Buffers also used for vertices etc. Buffer data and buffer arrays (will see in creating objects)
- No window system interactions (for portability)
  - But can use GLUT / FreeGLUT (or Motif, GLX, Tcl/Tk)
  - Callbacks to implement mouse, keyboard interaction

Outline

- Basic idea about OpenGL
- Basic setup and buffers
- Matrix modes
- Window system interaction and callbacks
- Drawing basic OpenGL primitives
- Initializing Shaders

Basic initialization code for viewing

```c
#include <GL/glut.h> //also <GL/glew.h> <GLUT/glut.h> for Mac OS
//include <GL/gl.h> //openGL.h, assert.h, glew, others

int mouseoldx, mouseoldy; //For mouse motion
GLfloat eyeloc = 2.0; //Where to look from; initially 0 -2, 2
glm::mat4 projection, modelview; //The mvp matrices themselves

void init (void)
{
    //select clearing color
    glClearColor (0.0, 0.0, 0.0, 0.0);

    /* initialize viewing values */
    projection = glm::mat4::identity(); //The identity matrix

    //Think about this. Why is the up vector not normalized?
    modelview = glm::lookAt(glm::vec3(0.0, 0.0, 0.0),
                            glm::vec3(0.0, 0.0, 0.0), glm::vec3(0.0, 1.0, 0.0));

    //To be cont’d. Geometry and shader set up later ...
}
```

Basic Setup (can copy; slight OS diffs)

```c
int main(int argc, char** argv)
{
    glutInit(&argc, argv);
    //Requests the type of buffers (Single, RGB).
    //Think about what buffers you would need...
    glutInitDisplayMode (GLUT_SINGLE | GLUT_RGB);
    //Need to add GLUT_3_2_CORE_PROFILE for Apple/Mac OS
    glutInitWindowPosition (100, 100);
    glutCreateWindow ("Simple Demo with Shaders");
    //gl.awtInit(); //GLEW related stuff for non-Apple systems
    //Always initialize first
    //Now, we define callbacks and functions for various tasks.
    glutDisplayFunc(display);
    glutReshapeFunc(reshape);
    glutKeyboardFunc(keyboard);
    glutMouseFunc(mouse);
    glutMotionFunc(mousedrag);
    glutMainLoop(); //Start the main code
    deleteBuffers(); //Termination. Delete buffers generated in init()
    return 0; //ANSI C requires main to return int. */
}
```

Viewing in OpenGL

- Inspired by old OpenGL. Now, only best practice, not requirement
  - You could do your own thing, but this is still the best way to develop viewing
- Viewing consists of two parts
  - Object positioning: model view transformation matrix
  - View projection: projection transformation matrix
- Old OpenGL (no longer supported/taught in 167), two matrix stacks
  - GL_MODELVIEW_MATRIX, GL_PROJECTION_MATRIX
  - Could push and pop matrices onto stacks
- New OpenGL: Use C++ STL templates to make stacks as needed
  - e.g. stack <mat4> modelview ; modelview.push(mat4(1.0)) ;
  - GLM libraries replace many deprecated commands. Include mat4
- Convention: camera always at the origin, pointing in the –z direction
- Transformations move objects relative to the camera
- In old OpenGL, Matrices are column-major and right-multiply top of stack. (Last transform in code is first actually applied). In new GLM, similarly (read the assignment notes and documentation)
**Window System Interaction**

- Not part of OpenGL
- Toolkits (GLUT) available (red book: freeglut)
- Callback functions for events
  - Keyboard, Mouse, etc.
  - Open, initialize, resize window
  - Similar to other systems (X, Java, etc.)
- Our main func included
  
  ```
  glutDisplayFunc(display);
  glutKeyboardFunc(keyboard);
  glutMouseFunc(mouse);
  glutMotionFunc(mousedrag);
  ```

**Basic window interaction code**

```c
/* Defines what to do when various keys are pressed */
void keyboard(unsigned char key, int x, int y)
{
    switch (key) {
    case 27: // Escape to quit
        exit(0);
        break;
    default:
        break;
    }
}

/* Reshapes the window appropriately */
void reshape(int w, int h)
{
    glViewport(0, 0, (GLsizei) w, (GLsizei) h);
    // Note that the field of view takes in a radian angle
    projection = glm::perspective(30.0f / 180.0f * glm::pi<float>(),
                                 (GLfloat)w / (GLfloat)h, 1.0f, 10.0f);
    glUniformMatrix4fv(projectionPos, 1, GL_FALSE, &projection[0][0]);
    // To send the projection matrix to the shader
}
```

**Mouse motion (demo)**

```c
/* Defines a Mouse callback to zoom in and out */
/* This is done by modifying gluLookAt */
/* The actual motion is in mousedrag */
/* Mouse simply sets state for mousedrag */
void mouse(int button, int state, int x, int y)
{
    if (button == GLUT_LEFT_BUTTON) {
        if (state == GLUT_UP) {
            // Do Nothing ;
        } else if (state == GLUT_DOWN) {
            mouseoldx = x; mouseoldy = y; // so we can move wrt x, y
        }
    } else if (button == GLUT_RIGHT_BUTTON && state == GLUT_DOWN) {
        // Reset gluLookAt
        eyeloc = 2.0;
        modelview = glm::lookAt(glm::vec3(0, -eyeloc, eyeloc),
                                glm::vec3(0, 0, 0), glm::vec3(0, 1, 1));
        // Send the updated matrix to the shader
        glUniformMatrix4fv(modelviewPos, GL_FALSE, &modelview[0][0]);
        glutPostRedisplay(); // Redraw scene
    }
}
```

**Mouse drag (demo)**

```c
void mousedrag(int x, int y) {
    int glx = y = mouseoldy; // We will use the y coord to
    zoom in/out
    eyeloc += 0.005*yloc; // Where do we look from
    if (eyeloc < 0) eyeloc = 0.0;
    mouseoldy = y;
    /* Set the eye location */
    modelview = glm::lookAt(glm::vec3(0, -eyeloc, eyeloc),
                            glm::vec3(0, 0, 0), glm::vec3(0, 1, 1));
    // Send the updated matrix to the shader
    glUniformMatrix4fv(modelviewPos, GL_FALSE, &modelview[0][0]);
    glutPostRedisplay();
}
```

**Outline**

- Basic idea about OpenGL
- Basic setup and buffers
- Matrix modes
- Window system interaction and callbacks
- Drawing basic OpenGL primitives
- Initializing Shaders

**New OpenGL Primitives (fewer)**

- Points
- Lines (also strips, loops)
- Polygon
- Triangle
- Quad
- Triangle Strip
- Triangle Fan
- Quad Strip
Geometry

- Points (GL_POINTS)
  - Stored in Homogeneous coordinates

- Line segments (GL_LINES)
  - Also (GL_LINE_STRIP, GL_LINE_LOOP)

- Triangles (GL_TRIANGLES)
  - Also strips, fans (GL_TRIANGLE_STRIP, GL_TRIANGLE_FAN)

- More complex primitives (GLUT): Sphere, teapot, cube, ...
  - Must now be converted into triangles (which is what skeleton does)

Old OpenGL: Drawing

- Enclose vertices between glBegin() ... glEnd() pair
- Can include normal C code and attributes like the colors
- Inside are commands like glVertex3f, glColor3f
- Attributes must be set before the vertex

- Assembly line (pass vertices, transform, shade)
  - These are vertex, fragment shaders on current GPUs
  - Immediate Mode: Sent to server and drawn

- Client-Server model (client generates vertices, server draws) even if on same machine
  - giFlush() forces client to send network packet
  - glFinish() waits for ack, sparingly use synchronization

New OpenGL: Vertex Array Objects (next)

Modern OpenGL: Floor Specification

const GLfloat floorverts[4][3] = {
  {0.5, 0.5, 0.0}, {-0.5, 0.5, 0.0},
  {-0.5, -0.5, 0.0}, {0.5, -0.5, 0.0}
} ;

const GLfloat floorcol[4][3] = {
  {1.0, 0.0, 0.0}, {0.0, 1.0, 0.0},
  {0.0, 0.0, 1.0}, {1.0, 1.0, 1.0}
} ;

const GLubyte floorinds[1][6] = { {0, 1, 2, 0, 2, 3} } ; //tris

const GLfloat floorverts2[4][3] = {
  {0.5, 0.5, 1.0}, {-0.5, 0.5, 1.0},
  {-0.5, -0.5, 1.0}, {0.5, -0.5, 1.0}
} ;

const GLfloat floorcol2[4][3] = {
  {1.0, 0.0, 0.0}, {1.0, 0.0, 0.0},
  {1.0, 0.0, 0.0}, {1.0, 0.0, 0.0}
} ; // all red and on top

const GLubyte floorinds2[1][6] = { {0, 1, 2, 0, 2, 3} } ; //tris

Modern OpenGL: Initialize Buffers

void initbuffer (GLuint object, GLuint * vert, GLint sizevert, GLuint * col, GLint sizecol, GLuint * inds, GLint sizeind, GLenum type) {
  GLuint buffers[8] = {0} ;
  int offset = object * 3;
  glBindVertexArray(VAOs[object]);
  glBindBuffer(GL_ARRAY_BUFFER, buffers[0 + offset]);
  glBufferData(GL_ARRAY_BUFFER, sizevert, vert, GL_STATIC_DRAW);
  glEnableVertexAttribArray(0);
  glVertexAttribPointer(0, 3, GL_FLOAT, GL_FALSE, 3 * sizeof(GLfloat), 0);
  glBindBuffer(GL_ARRAY_BUFFER, buffers[1 + offset]);
  glBufferData(GL_ARRAY_BUFFER, sizecol, col, GL_STATIC_DRAW);
  glEnableVertexAttribArray(1);
  glVertexAttribPointer(1, 3, GL_FLOAT, GL_FALSE, 3 * sizeof(GLfloat), 0);
  glBindBuffer(GL_ELEMENT_ARRAY_BUFFER, buffers[2 + offset]);
  glBufferData(GL_ELEMENT_ARRAY_BUFFER, sizeind, inds, GL_STATIC_DRAW);
  PrimType[object] = type;
  NumElems[object] = sizeind;
  glBindVertexArray(0);
}
Modern OpenGL: Draw Vertex Object

```c
void drawobject(GLuint object) {
    glBindVertexArray(VAOs[object]);
    glDrawElements(PrimType[object], NumElems[object],
                   GL_UNSIGNED_BYTE, 0);
    glBindVertexArray(0);  // unbind
}
```

```c
void display(void) {
    glClear (GL_COLOR_BUFFER_BIT); // clear all pixels
drawobject(FLOOR) ;
drawobject(FLOOR2)
glFlush (); // start processing buffered OpenGL commands
}
```

Initialization for Drawing, Shading

```c
#include "shaders.h"
GLuint vertexshader, fragmentshader, shaderprogram ; // shaders
// Initialization in init() for Drawing
glGenVertexArrays(numobjects, VAOs) ;
glGenBuffers(numperobj*numobjects, buffers) ;
initobject(FLOOR, (GLfloat *) floorverts, sizeof(floorverts), (GLfloat *)
          floorcol, sizeof (floorcol), (GLubyte *) floorinds, sizeof (floorinds),
          GL_TRIANGLES) ;
initobject(FLOOR2, (GLfloat *) floorverts2, sizeof(floorverts2),
          (GLfloat *) floorcol2, sizeof (floorcol2), (GLubyte *) floorinds2,
          sizeof (floorinds2), GL_TRIANGLES) ;
// In init() for Shaders, discussed next
vertexshader = initshaders(GL_VERTEX_SHADER, "shaders/nop.vert") ;
fragmentshader = initshaders(GL_FRAGMENT_SHADER, "shaders/nop.frag") ;
shaderprogram = initprogram(vertexshader, fragmentshader) ;
```

Outline

- Basic idea about OpenGL
- Basic setup and buffers
- Matrix modes
- Window system interaction and callbacks
- Drawing basic OpenGL primitives
- Initializing Shaders

Full OpenGL Pipeline

User/program generates original vertices, textures
We cover programmable vertex and fragment shaders in course
OpenGL primitive setup, clipping, rasterization not programmable
Tessellation shaders take patches (splines) to output vertices
Geometry shaders process primitives, can add/remove geometry

Demo (change colors)

Outline

Simplified OpenGL Pipeline

- User specifies vertices (via vertex arrays)
- For each vertex in parallel
  - OpenGL calls user-specified vertex shader:
    Transform vertex (ModelView, Projection), other ops
- For each primitive, OpenGL rasterizes
  - Generates a fragment for each pixel the fragment covers
- For each fragment in parallel
  - OpenGL calls user-specified fragment shader:
    Shading and lighting calculations
  - OpenGL handles z-buffer depth test unless overwritten
- Modern OpenGL is “lite” basically just a rasterizer
  - “Real” action in user-defined vertex, fragment shaders
Shader Setup

- Initializing (shader itself discussed later)
  1. Create shader (Vertex and Fragment)
  2. Compile shader
  3. Attach shader to program
  4. Link program
  5. Use program
- Shader source is just sequence of strings
- Similar steps to compile a normal program

Linking Shader Program

```cpp
GLuint initprogram (GLuint vertexshader, GLuint fragmentshader) {
    GLuint program = glCreateProgram();
    GLint linked;
    glAttachShader(program, vertexshader);
    glAttachShader(program, fragmentshader);
    glLinkProgram(program);
    glGetProgramiv(program, GL_LINK_STATUS, &linked);
    if (!linked) {
        glUseProgram(program);
        throw 4;
    }
    cout << "Shader program successfully attached and linked." << endl;
    return program;
}
```

Basic (nop) vertex shader

```cpp
// Written in GLSL (GL Shading Language)
// Vertex Shader (out values interpolated to fragment)

# version 330 core
// Do not modify the above version directive to anything older.

// Shader inputs
layout (location = 0) in vec3 position;
layout (location = 1) in vec3 color;

// Uniform variables
uniform mat4 modelview;
uniform mat4 projection;

void main() {
    gl_Position = projection * modelview * vec4(position, 1.0f);
    Color = color; // Just forward this color to the fragment shader
}
```

Basic (nop) fragment shader

```cpp
// Do not modify the version directive to anything older than 330.

// Fragment shader inputs are outputs of same name from vertex shader
// in vec3 Color:

// Uniform variables (none)

// Output
out vec4 FragColor;

void main (void) {
    FragColor = vec4(Color, 1.0f);
}
```
