

Networking and PA5

Hannah Davis,
with slides from Ariana Mirian and Nadia Heninger

Original Idea:

- Network is dumb
- Simple, robust service
- Shift complexity to endpoints
- Acts like postal system (packet-based) rather than traditional phone system (circuit-based)

OSI Layers

(Open Systems Interconnection)

Application

- End user layer
- HTTP, FTP, Skype, SSH, SMTP, DNS

Presentation

- Syntax, byte order, compression, encryption
- SSL, SSH, MPEG, JPEG

Session

- Connection establishment and maintenance
- APIs, sockets

Transport

- End-to-end connections between processes
- TCP, UDP

Network

- Addressing, routing between nodes
- IP

Data Link

- Link management, frames
- Ethernet, WiFi

Physical

- Physical wires
- Photons, RF modulation

Internet Architecture

Using the internet: A worked example

You connect your laptop to a cafe wifi network and type `ucsd.edu` into your browser's URL bar. What happens?

Using the internet: A worked example

~~You connect your laptop to a cafe wifi network and type `ucsd.edu` into your browser's URL bar. What happens?~~

You are waiting masked and outdoors for a takeout order from a cafe, and while you're waiting you perch against the wall at a socially distant distance from everyone else, pull your laptop out, connect to the cafe's wifi network and type `ucsd.edu` into the browser's URL bar.

Using the Internet: a worked example

1. Your laptop uses **DHCP (Dynamic Host Configuration Protocol)** to bootstrap itself on the local network via **WiFi** over **radio waves**

Using the Internet: a worked example

1. Your laptop uses **DHCP (Dynamic Host Configuration Protocol)** to bootstrap itself on the local network via **WiFi** over **radio waves**
 - New host has no **IP** address, doesn't know who to ask

Using the Internet: a worked example

1. Your laptop uses **DHCP (Dynamic Host Configuration Protocol)** to bootstrap itself on the local network via **WiFi** over **radio waves**
 - New host has no **IP** address, doesn't know who to ask
 - Broadcasts DHCPDISCOVER to 255.255.255.255 with its **MAC address**

Using the Internet: a worked example

1. Your laptop uses **DHCP (Dynamic Host Configuration Protocol)** to bootstrap itself on the local network via **WiFi** over **radio waves**
 - New host has no **IP** address, doesn't know who to ask
 - Broadcasts DHCPDISCOVER to **255.255.255.255** with its **MAC address**
 - DHCP server responds with config:lease on host IP address, gateway IP address, DNS server information

Using the Internet: a worked example

2. Your laptop makes an **ARP** request to learn the **MAC address** of the local router.

Using the Internet: a worked example

2. Your laptop makes an **ARP** request to learn the **MAC address** of the local router.

- Every connection outside the local network will be encapsulated in a **link-layer** frame with the local router's MAC address as the destination.
- Your laptop encapsulates each **IP** packet in a **WiFi** frame addressed to the local router

Using the Internet: a worked example

2. Your laptop makes an **ARP** request to learn the **MAC address** of the local router.

- Every connection outside the local network will be encapsulated in a **link-layer** frame with the local router's MAC address as the destination.
- Your laptop encapsulates each **IP** packet in a **WiFi** frame addressed to the local router
- The router removes the **WiFi frame** and adds an **Ethernet frame** to forward them on its fiber connection to its upstream ISP, or to another part of the network.
- Each hop re-encodes the link layer for its own network.

Using the Internet: a worked example

3. Your laptop does a **DNS** lookup on `ucsd.edu`

- It learned the IP address of a DNS server from the router or had one already hardcoded in (8.8.8.8)
- The **DNS** request is tunneled through **UDP packets** which are themselves inside **IP packets**

Using the Internet: a worked example

3. Your laptop does a **DNS** lookup on `ucsd.edu`

- It learned the IP address of a DNS server from the router or had one already hardcoded in (8.8.8.8)
- The **DNS** request is tunneled through **UDP packets** which are themselves inside **IP packets**
- The DNS server responds with either “`ucsd.edu` has IP address `x.x.x.x`” or “I don’t know, but the nameserver at `y.y.y.y` might”
 - Follows a hierarchy upward: your ISP, then the `.edu` nameserver, then UCSD’s nameserver.
 - Eventually, get final IP address **132.239.180.101**

Using the Internet: a worked example

4. Your laptop opens a **TCP** connection to IP address 132.239.180.101.

- Unlike **UDP**, has reliability.

Using the Internet: a worked example

4. Your laptop opens a **TCP** connection to IP address 132.239.180.101.

- Unlike **UDP**, has reliability.
- **TCP** is wrapped in **IP** which is wrapped in **Ethernet**

Using the Internet: a worked example

4. Your laptop opens a **TCP** connection to IP address 132.239.180.101.

- Unlike **UDP**, has reliability.
- **TCP** is wrapped in **IP** which is wrapped in **Ethernet**
- Each stop in the network checks its routing table against the destination **IP** address.
- E.g. sbcglobal.net-> att.net-> leve3.net -> cenic.net-> ucsd.edu

Using the Internet: a worked example

5. Your laptop sends an **HTTP GET** request across the **TCP** connection.

Using the Internet: a worked example

5. Your laptop sends an **HTTP GET** request across the **TCP** connection.

Using the Internet: a worked example

5. Your laptop sends an **HTTP GET** request across the **TCP** connection.

- If you're using **HTTPS**, it performs a **TLS handshake** and **encrypts** the request before splitting it into **TCP** packets.

Using the Internet: a worked example

5. Your laptop sends an **HTTP GET** request across the **TCP** connection.

- If you're using **HTTPS**, it performs a **TLS handshake** and **encrypts** the request before splitting it into **TCP** packets.
- Any future connections restart from step 3 with a new DNS request.

PA 5 introduction

- Scavenger hunt
- Begins tomorrow
- Starting point: your email
- Unzip the .tar file, and try to find hidden information
- The file will tell you what to submit
- Start early! It can be hard to tell how close you are to finishing.
- Be considerate of spoilers: try to use mainly OH and private Piazza posts for questions.
- Have fun!

Overview of tools you may need

- nc
- nmap
- ssh
- tcpdump
- wget

Overview of tools you may need

- Nc – allows you to make connections locally
 - Nmap – scan ports/IPs (locally and externally)
 - Ssh – connect to servers
 - Tcpdump – view traffic on machine
 - Wget – download of files from internet
-
- All of these have “man” pages!

NetCat (shoutout to Julia Evans)

netcat

JULIA EVANS
wizardzines.com

nc

like 'cat' for your network!

it lets you create
TCP (or UDP) connections
from the command line
& send/receive data

nc -l PORT

start a server! this
listens on PORT &
prints everything received

nc IP PORT

be a client! opens a
TCP/UDP connection
to IP:PORT.

send files

want to send a 100 GB file
to someone on the same wifi
network? easy!

receiver:

```
nc -l 8080 > file
```

sender: 192.168.x.x

```
cat file | nc YOUR_IP 8080
```

make HTTP requests by hand

```
|printf 'GET / HTTP/  
1.1\nHost:  
example.com\r\n\r\n'  
| nc example.com 80
```

type in any weird HTTP
request you want! 😊

I ♥ that sending
files trick! it works
on your local
network even if
you're not connected
to the internet!

Happy hunting!
