Chapter 9 Unconstrained Minimization

- Introduction
- Taylor's Expansion & Bounds
- Descent Methods
- Newton Method
- Summary

2

Introduction

Problem: $\min f(x)$ where $f: \mathbb{R}^n \rightarrow \mathbb{R}$
is convex and twice continuously differentiable

Theorem: Necessary and sufficient condition for a point x^* to be optimal is $\nabla f(x^*) = 0$.

$$\nabla^2 f(x^*) \geq 0$$

Remark: keywords Taylor's expansion

3

Taylor's Expansion & Bounds: Scalar case

$$f(x) = f(x_0) + \nabla f(x_0)^T (x - x_0) + \frac{1}{2} (x - x_0)^T \nabla^2 f(z) (x - x_0)$$

for some z on the segment $[x, x_0]$

(1) **Scalar case:** $f(x) = f(x_0) + f'(x_0)(x - x_0) + \frac{1}{2} f''(z)(x - x_0)^2$

We simplify the notations $f(x) = \frac{m}{2} (x - x_0)^2 + a(x - x_0) + b$

For fixed m , a , and b , the optimal solution can be derived as:

$$\nabla f(x) = 0 \Rightarrow m(x - x_0) + a = 0 \Rightarrow x - x_0 = -\frac{a}{m}$$

Thus, we have

$$f(x) = \frac{m}{2} \frac{a^2}{m^2} + a \frac{(-a)}{m} + b = \frac{a^2}{2m} - \frac{a^2}{m} + b = \frac{-a^2}{2m} + b$$

Or $f(x) - f(x_0) = -\frac{a^2}{2m}$

a. How far from opt. x^* ? $x^* - x_0 = -\frac{a}{m}$

b. How much difference from opt. $f(x_0) - f(x^*) = \frac{a^2}{2m}$

4

Taylor's Expansion & Bounds: Example

$$f(x) = x^2 + 4x + 1$$

For the format

$$f(x) = \frac{m}{2}x^2 + ax + b, \quad m = 2, a = 4, b = 1.$$

Let $x_0 = 0$, we have the answer.

a. *How far?* $x^* - x_0 = -\frac{a}{m} = -2$

b. *How much?* $f(x_0) - f(x^*) = \frac{a^2}{2m} = 4$

5

Taylor's Expansion & Bounds: Bounds

(2) **Vector case:**

Assumption A: $\nabla^2 f(x)$ is bounded, i.e. $mI \preceq \nabla^2 f(x) \preceq MI$

Theorem A: We have the following bounds

$$\frac{1}{M} \|\nabla f(x_0)\|_2 \stackrel{\textcircled{4}}{\leq} \|x_0 - x^*\|_2 \stackrel{\textcircled{1}}{\leq} \frac{2}{m} \|\nabla f(x_0)\|_2$$

$$\frac{1}{2M} \|\nabla f(x_0)\|_2^2 \stackrel{\textcircled{3}}{\leq} f(x_0) - p^* \stackrel{\textcircled{2}}{\leq} \frac{1}{2m} \|\nabla f(x_0)\|_2^2$$

Proof: ①

$$f(x) + \nabla f(x)^T (y - x) + \frac{m}{2} \|y - x\|_2^2 \leq f(y)$$

$$\leq f(x) + \nabla f(x)^T (y - x) + \frac{M}{2} \|y - x\|_2^2$$

(Taylor's Expansion + Assumption A)

6

Taylor's Expansion & Bounds: Bounds

Proof ①: $\|x - x^*\|_2 \leq \frac{2}{m} \|\nabla f(x)\|_2$

$p^* = f(x^*) \geq f(x) + \nabla f(x)^T(x^* - x) + \frac{m}{2} \|x^* - x\|_2^2$ (Taylor's exp + Assumption A.)

$$\geq f(x) - \|\nabla f(x)\|_2 \|x^* - x\|_2 + \frac{m}{2} \|x^* - x\|_2^2$$

We shift $f(x)$ to the left hand side.

$$0 \geq p^* - f(x) \geq -\|\nabla f(x)\|_2 \|x^* - x\|_2 + \frac{m}{2} \|x^* - x\|_2^2$$

Shift $-\|\nabla f(x)\|_2 \|x^* - x\|_2$ to the left,

$$\|\nabla f(x)\|_2 \|x^* - x\|_2 \geq \frac{m}{2} \|x^* - x\|_2^2$$

Therefore we have

1. $\|\nabla f(x)\|_2 \geq \frac{m}{2} \|x^* - x\|_2$

2. $\|x^* - x\|_2 \leq \frac{2}{m} \|\nabla f(x)\|_2$

7

Taylor's Expansion & Bounds: Bounds

Proof ②: $f(y) \geq f(x) + \nabla f(x)^T(y - x) + \frac{m}{2} \|y - x\|_2^2$

(Taylor's exp + assumption A.)

$$\geq f(x) - \frac{1}{2m} \|\nabla f(x)\|_2^2 \text{ (Minimization with } y)$$

Thus, we have

$$f(x) - f(y) \leq \frac{1}{2m} \|\nabla f(x)\|_2^2, \quad \forall y$$

Therefore

$$f(x) - f(x^*) \leq \frac{1}{2m} \|\nabla f(x)\|_2^2$$

8

Taylor's Expansion & Bounds: Bounds

Proof ③: $f(y) \geq f(x) + \nabla f(x)^T(y - x) + \frac{m}{2} \|y - x\|_2^2$
 (Taylor's exp + assumption A.)
 $\geq f(x) - \frac{1}{2m} \|\nabla f(x)\|_2^2$ (Minimization with y)

Let $y = x - \frac{1}{M} \nabla f(x)$, we have

$$\begin{aligned} f\left(x - \frac{1}{M} \nabla f(x)\right) &\leq f(x) + \nabla f(x)^T \frac{-1}{M} \nabla f(x) + \frac{M}{2} \left\| \frac{1}{M} \nabla f(x) \right\|_2^2 \\ &= f(x) - \frac{1}{2M} \|\nabla f(x)\|_2^2 \end{aligned}$$

Shift the terms on the left and right, we have

$$\begin{aligned} \frac{1}{2M} \|\nabla f(x)\|_2^2 &\leq f(x) - f\left(x - \frac{1}{M} \nabla f(x)\right) \\ &\leq f(x) - f(x^*) \end{aligned}$$

9

Taylor's Expansion & Bounds: Bounds

(4) Proof: $f(y) \leq f(x) + \nabla f(x)^T(y - x) + \frac{M}{2} \|y - x\|_2^2$

(Taylor's exp. + assumption A)

(i) Let $x = x^*$, we have $\nabla f(x^*) = 0$,
 thus, we can write the above eq.

$$\begin{aligned} f(y) &\leq f(x^*) + \frac{M}{2} \|y - x^*\|_2^2 \\ \text{or } f(y) - p^* &\leq \frac{M}{2} \|y - x^*\|_2^2 \end{aligned}$$

(ii) From (3), we have

$$\frac{1}{2M} \|\nabla f(x_o)\|_2^2 \leq f(x_o) - p^*$$

(iii) From (i)&(ii), we have

$$\frac{1}{2M} \|\nabla f(x_o)\|_2^2 \leq \frac{M}{2} \|x_o - x^*\|_2^2$$

Therefore, we have

$$\frac{1}{M} \|\nabla f(x_o)\|_2 \leq \|x_o - x^*\|_2$$

10

II. Descent Methods: Example

Problem: $\min f(x) = \frac{1}{2}(x_1^2 + \gamma x_2^2) \quad \gamma > 0$

$$x^0 = (\gamma, 1), f(x^0) = \frac{\gamma(\gamma+1)}{2}, \nabla f(x^0) = (\gamma, \gamma)$$

Thus, $x^1 = (\gamma, 1) - t(\gamma, \gamma) = (\gamma(1-t), 1-t\gamma)$

and $\nabla f(x^1) = (\gamma(1-t), \gamma(1-t\gamma))$

1. To opt $f(x^1)$ with respect to variable t ,

we have $f(x^1) = \frac{1}{2}(\gamma^2(1-t)^2 + \gamma(1-t\gamma)^2)$

$$\frac{\partial f(x^1)}{\partial t} = \gamma^2(1-t) + \gamma(1-t\gamma)\gamma = 0$$

Thus, $t = \frac{2\gamma^2}{\gamma^2 + \gamma^3} = \frac{2}{1+\gamma}$, and $x^1 = \left(\frac{\gamma(\gamma-1)}{1+\gamma}, \frac{1-\gamma}{1+\gamma}\right) = \left(\frac{10 \times 9}{11}, -\frac{9}{11}\right)$

2. We repeat the process to step k , $x^k = \left(\gamma \left(\frac{\gamma-1}{\gamma+1}\right)^k, \left(\frac{1-\gamma}{1+\gamma}\right)^k\right)$

3. Equal potential plot

$$f(x^k) = \frac{\gamma(\gamma+1)}{2} \left(\frac{\gamma-1}{\gamma+1}\right)^{2k} = \left(\frac{\gamma-1}{\gamma+1}\right)^{2k} f(x^0) = \left(\frac{1-m/M}{1+m/M}\right)^{2k} f(x^0)$$

13

II. Descent Methods: Descent for various norms

1. Problem: $\text{Min } f(x)$

2. For each iteration, we try the steepest descent in terms of a given norm.

$$\begin{aligned} &\text{Min } \nabla f(x)^T \Delta x \\ &\text{s.t. } \|\Delta x\| \leq 1 \end{aligned}$$

3. We show the step of

- i. Quadratic norm
- ii. L1 norm

II. Descent Methods: Descent for quadratic norm

1. Problem: Min $f(x)$
2. For each iteration, we try the steepest descent in terms of a given norm.

$$\begin{aligned} \text{Min}_{\Delta x} \quad & \nabla f(x)^T \Delta x \\ \text{s.t.} \quad & \|\Delta x\|_P \leq 1 \end{aligned}$$

$$\|\Delta x\|_P = (\Delta x^T P \Delta x)^{1/2}, P \in S_{++}^n$$

$$\text{Lagrangian } L(\Delta x, \lambda) = \nabla f(x)^T \Delta x + \lambda (\|\Delta x\|_P - 1), \lambda \geq 0$$

$$\text{We can derive: } \Delta x_{nsd} = -(\nabla f(x)^T P^{-1} \nabla f(x))^{-1/2} P^{-1} \nabla f(x)$$

$$\text{Or } \Delta x_{sd} = -P^{-1} \nabla f(x)$$

$$\nabla_{\Delta x} L(\Delta x, \lambda) = \nabla f(x) + \lambda P \Delta x = 0$$

$$\Delta x = \frac{-1}{\lambda} P^{-1} \nabla f(x)$$

15

II. Descent Methods: Descent for quadratic norm

The coordinate change has effects on the descent direction.

$$\text{Example: } \min f(x) = \frac{1}{2} x^T P x + q^T x, P \in S_{++}^n$$

$$\text{Affine transform: } \bar{x} = P^{1/2} x \quad ((P^{1/2})^2 = P)$$

No transform.

$$\nabla_x f(x) = P x + q = 0 \Rightarrow x = -P^{-1} q$$

Transform
 $x = P^{-1/2} \bar{x}$

$$f(\bar{x}) = \frac{1}{2} \bar{x}^T \bar{x} + q^T P^{-1/2} \bar{x}$$

$$\nabla_{\bar{x}} f(\bar{x}) = \bar{x} + P^{-1/2} q = 0 \Rightarrow \bar{x} = -P^{-1/2} q$$

$$\Rightarrow P^{1/2} x = -P^{-1/2} q$$

$$\Rightarrow x = -P^{-1} q$$

16

II. Descent Methods: Descent for L1 norm

1. Problem: Min $f(x)$
2. For each iteration, we try the steepest descent in terms of a given norm.

$$\text{Min } \nabla f(x)^T \Delta x < 0$$

$$\text{s.t. } \|\Delta x\|_1 \leq 1$$

$$\text{Lagrangian } L(\Delta x, \lambda) = \nabla f(x)^T \Delta x + \lambda (\|\Delta x\|_1 - 1), \lambda \geq 0$$

$$\text{We can derive: } \Delta x_{nsd} = -\text{sign}\left(\frac{\partial f(x)}{\partial x_i}\right) e_i,$$

$$\text{where } i \text{ is the index for which } \|\nabla f(x)\|_\infty = |\nabla f(x)_i|$$

$$\text{Or } \Delta x_{sd} = -\frac{\partial f(x)}{\partial x_i} e_i$$

17

Gradient descent method: Convergence analysis

$$\tilde{f}(t) \equiv f(x - t\nabla f(x)) \leq f(x) - t\|\nabla f(x)\|_2^2 + \frac{Mt^2}{2} \|\nabla f(x)\|_2^2$$

$$\tilde{f}(t_{exact}) \leq \tilde{f}\left(t = \frac{1}{M}\right) \leq f(x) - \frac{1}{2M} \|\nabla f(x)\|_2^2 \quad (\min_t f(x) \nabla f(x))$$

$$\text{A. } \tilde{f}(t_{exact}) - p^* \leq f(x) - p^* - \frac{1}{2M} \|\nabla f(x)\|_2^2$$

$$\text{B. } \frac{1}{2M} \|\nabla f(x)\|_2^2 \geq \frac{m}{M} (f(x) - p^*) \text{ since } \frac{\|\nabla f(x)\|_2^2}{2m} \geq f(x) - p^*$$

C. From B, we have

$$\begin{aligned} f(x) - p^* - \frac{1}{2M} \|\nabla f(x)\|_2^2 &\leq f(x) - p^* - \frac{m}{M} (f(x) - p^*) \\ &= (f(x) - p^*) \left(1 - \frac{m}{M}\right) \end{aligned}$$

D. We can conclude from A & C

$$f(x^{k+1}) - p^* \leq \left(1 - \frac{m}{M}\right) (f(x^k) - p^*) \leq \left(1 - \frac{m}{M}\right)^k (f(x^0) - p^*)$$

To achieve $f(x^*) - p^* \leq \epsilon$,

$$\text{we need } \frac{\log((f(x^0) - p^*)/\epsilon)}{\log(1/c)} \text{ steps, where } c = 1 - \frac{m}{M} < 1,$$

18

Gradient descent method : Convergence analysis

$\log(1/c) = -\log(1 - m/M) \approx m/M$ for large M/m

Remark: when $M/m > 100$

the method can be very slow.

19

Newton Step

Use the approximation of 2nd order Taylor's Exp.

$$f(x + v) \approx f(x) + \nabla f(x)^T v + \frac{1}{2} v^T \nabla^2 f(x) v$$

We would like to derive

$$\nabla_v f(x + v) = 0 \rightarrow \nabla f(x) + \nabla^2 f(x) v = 0$$

Thus, we have $v = -\nabla^2 f(x)^{-1} \nabla f(x)$

$$\begin{aligned} f(x + v) &= f(x) + (-1) \nabla f(x)^T \nabla^2 f(x)^{-1} \nabla f(x) + \\ &\quad \frac{1}{2} \nabla f(x)^T \nabla^2 f(x)^{-1} \nabla f(x) \\ &= f(x) - \frac{1}{2} \nabla f(x)^T \nabla^2 f(x)^{-1} \nabla f(x) \end{aligned}$$

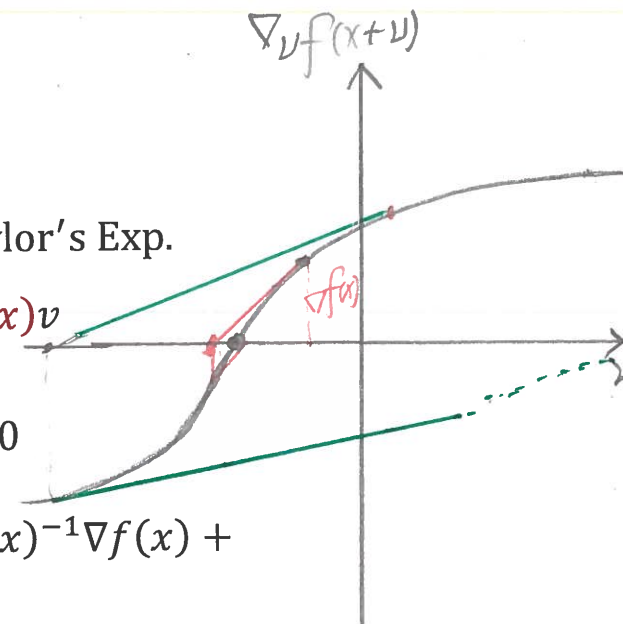

Input $x \in \text{dom } f$, $\epsilon > 0$

Repeat: 1. $\Delta x_{nt} := -\nabla^2 f(x)^{-1} \nabla f(x)$, $\lambda^2(x) = \nabla f(x)^T \nabla^2 f(x)^{-1} \nabla f(x)$

2. Quit if $\lambda^2/2 \leq \epsilon$

③ Line Search t

4. $x := x + t \Delta x_{nt}$

20
