CSE 127: Computer Security

Web Intro

Nadia Heninger
UCSD

Winter 2023

Some slides from Deian Stefan, Zakir Durumeric, Dan Boneh, and Kirill Levchenko
Lecture objectives

• Basic understanding of how the web works
• Understand relevant attacker models
• Understand browser same-origin policy
HTTP protocol

- Protocol from 1989 that allows fetching of resources (e.g., HTML documents)
- Resources have a uniform resource location (URL):

Part 2: echo in x86 (10 pts)

Files for this sub-assignment are located in the `x86` subdirectory of the `student` user's home directory in the VM image; that is, `/home/student/x86`. SSH into the VM and `cd` into that directory to begin working on it.

For this part, you will be implementing a simplified version of the familiar `echo` command, using raw x86 assembly code. The goal of this assignment is to familiarize you with writing programs directly in x86.

Your `echo` command must behave as follows:

- When run with a single command line argument (e.g., `./echo Hello`):
HTTP protocol

- Protocol from 1989 that allows fetching of resources (e.g., HTML documents)
- Resources have a uniform resource location (URL):
HTTP protocol

- Protocol from 1989 that allows fetching of resources (e.g., HTML documents)

Body

<html>Some data... whatever ... </html>
Many HTTP methods

- GET: Get the resource at the specified URL.
- POST: Create new resource at URL with payload.
- PUT: Replace current representation of the target resource with request payload.
- PATCH: Update part of the resource.
- DELETE: Delete the specified URL.
In practice: it’s a mess

• GETs should NOT change server state; in practice, they sometimes do

• Old browsers don’t send PUT, PATCH, and DELETE

  ➤ So, almost all side-effecting requests are POSTs; real method hidden in a header or request body
In practice: we need state
In practice: we need state

- HTTP cookie: small piece of data that a server sends to the browser, who stores it and sends it back with subsequent requests
- What is this useful for?
  - Session management: logins, shopping carts, etc.
  - Personalization: user preferences, themes, etc.
  - Tracking: recording and analyzing user behavior
In practice: we need state

Cookie: userID=F3D947C2
Host: www.example.com
Referer: http://www.google.com?q=dingbats
In practice: mix of HTTP/1.1, 2, and 3

- HTTP/2 used by 47% of the web* as of Oct 2021
  - Allows pipelining requests for multiple objects
  - Multiplexing multiple requests over one TCP connection
  - Header compression
  - Server push

- HTTP/3 used by 22% of the web
  - Uses QUIC instead of TCP

*top 10M sites
Going from HTTP response to code execution...
Basic browser execution model

- Each browser window...
  - Loads content
  - Parses HTML and runs Javascript
  - Fetches sub resources (e.g., images, CSS, JavaScript)
  - Respond to events like onClick, onMouseover, onLoad, setTimeout
Nested execution model

- Windows may contain frames from different sources
  - Frame: rigid visible division
  - iFrame: floating inline frame

- Why use frames?
Nested execution model

- Windows may contain frames from diff sources
  - Frame: rigid visible division
  - iFrame: floating inline frame

- Why use frames?
  - Delegate screen area to content from another source
  - Browser provides isolation based on frames
  - Parent may work even if frame is broken
Document object model (DOM)

- Javascript can read and modify page by interacting with DOM
  - OO interface for reading and writing website content
- Includes browser object model
  - Access window, document, and other state like history, browser navigation, and cookies

Modifying the DOM using JS

<html>
  <body>
    <ul id="t1">
      <li>Item 1</li>
    </ul>
  </body>
</html>
Modifying the DOM using JS

```html
<html>
  <body>
    <ul id="t1">
      <li>Item 1</li>
    </ul>
    ... 
  </body>
</html>

<script>
  const list = document.getElementById('t1');
  const newItem = document.createElement('li');
  const newText = document.createTextNode('Item 2');
  list.appendChild(newItem);
  newItem.appendChild(newText)
</script>
```
Modifying the DOM using JS

```html
<html>
  <body>
    <ul id="t1">
      <li>Item 1</li>
    </ul>
    ...
  </body>
</html>

<script>
  const list = document.getElementById('t1');
  const newItem = document.createElement('li');
  const newText = document.createTextNode('Item 2');
  list.appendChild(newItem);
  newItem.appendChild(newText)
</script>

Lecture objectives

• Basic understanding of how the web works
• Understand relevant attacker models
• Understand browser same-origin policy
Web security model

Safely browse the web in the presence of attackers

➤ The browser is the new OS analogy
Web security model

Safely browse the web in the presence of attackers

➤ The browser is the new OS analogy
Web security model

Safely browse the web in the presence of attackers

➤ The browser is the new OS analogy

Web security model

UIDs + ACLs
VM + UIDs + seccomp-bpf
Web security model

Safely browse the web in the presence of attackers

➤ The browser is the new OS analogy

Web security model

- VM + UIDs + seccomp-bpf
- files/sockets
- UIDs + ACLs
- cookies/fetch
Web security model

Safely browse the web in the presence of attackers

➤ The browser is the new OS analogy
Same origin policy (SOP)

- **Origin**: isolation unit/trust boundary on the web
  - (scheme, domain, port) triple derived from URL
- **SOP goal**: isolate content of different origins
  - **Confidentiality**: script contained in `evil.com` should not be able to read data in `bank.ch` page
  - **Integrity**: script from `evil.com` should not be able to modify the content of `bank.ch` page
There is no one SOP

• There is a same-origin policy for...
  ➤ the DOM
  ➤ message passing (via postMessage)
  ➤ network access
  ➤ CSS and fonts
  ➤ cookies
SOP for the DOM

- Each frame in a window has its own origin
- Frame can only access data with the same origin
  - DOM tree, local storage, cookies, etc.
SOP for the DOM

- Each frame in a window has its own origin
- Frame can only access data with the same origin
  - DOM tree, local storage, cookies, etc.
SOP for the DOM

- Each frame in a window has its own origin
- Frame can only access data with the same origin
  - DOM tree, local storage, cookies, etc.
SOP for the DOM

- Each frame in a window has its own origin
- Frame can only access data with the same origin
  - DOM tree, local storage, cookies, etc.
How do you communicate with frames?

- Message passing via postMessage API
  - Sender:
    
    ```javascript
    targetWindow.postMessage(message, targetOrigin);
    ```
  
  - Receiver:
    
    ```javascript
    function receiveMessage(event){
      if (event.origin !== "https://example.com")
        return;
      ...
    }
    ```
    
    ```javascript
    window.addEventListener("message", receiveMessage, false);
    ```
SOP for HTTP responses

- Pages can perform requests across origins
  - SOP does not prevent a page from leaking data to another origin by encoding it in the URL, request body, etc.

- SOP prevents code from directly inspecting HTTP responses
  - Except for documents, can often learn some information about the response
Documents

- Can load cross-origin HTML in frames, but not inspect or modify the frame content.

(https://a.com,443)
(https://b.com,443)
Documents

- Can load cross-origin HTML in frames, but not inspect or modify the frame content.
Documents

- Can load cross-origin HTML in frames, but not inspect or modify the frame content.

(https://a.com)

(https://b.com, 443)
Documents

- Can load cross-origin HTML in frames, but not inspect or modify the frame content.
Documents

- Can load cross-origin HTML in frames, but not inspect or modify the frame content.
Scripts

- Can load scripts from across origins
- Scripts execute with privileges of the page
- Page can see source via `func.toString()`
Scripts

- Can load scripts from across origins
- Scripts execute with privileges of the page
- Page can see source via `func.toString()`
Scripts

- Can load scripts from across origins
- Scripts execute with privileges of the page
- Page can see source via \texttt{func.toString()}

![Diagram showing script execution](https://example.com/diagram.png)
Images

- Browser renders cross-origin images, but SOP prevents page from inspecting individual pixels
- Page can see `img.width`
Images

- Browser renders cross-origin images, but SOP prevents page from inspecting individual pixels
- Page can see `img.width`
Images

- Browser renders cross-origin images, but SOP prevents page from inspecting individual pixels
- Page can see img.width
Images

- Browser renders cross-origin images, but SOP prevents page from inspecting individual pixels
- Page can see `img.width`

```javascript
if loggedIn(user) {
  then
} else {
}
```
Images

- Browser renders cross-origin images, but SOP prevents page from inspecting individual pixels
- Page can see `img.width`

```javascript
if loggedIn(user) then
else
```

40px
80px

(https://a.com,443)

(https://fb.com,443)

(https://a.com,443)
Images

- Browser renders cross-origin images, but SOP prevents page from inspecting individual pixels
- Page can see `img.width`

```javascript
if (img.width > 40) {
    //...
} else {
    //...
}
if (loggedIn(user))
    //
else
    //
```
SOP for fonts and CSS are similar.
SOP for cookies

Client echoes cookie back to server w/ every request

➤ Sending (only) to the right server is really important

➤ E.g., don’t send cookie for bank.com to attacker.com
SOP for cookies

- Cookies have a different notion of origin
- DOM SOP: origin is a (scheme, domain, port)
- Cookie SOP: ([scheme], domain, path)

➤ (https,cseweb.ucsd.edu, /classes/fa19/cse127-ab)
SOP: Cookie scope setting

- A page can set a cookie for:
  - its own domain
  - any parent domain, as long as domain is not a public suffix

- A page can read the cookies for:
  - its own domain
  - any sub-domain
SOP: Cookie scope setting

• A page can set a cookie for:
  ➤ its own domain
  ➤ any parent domain, as long as domain is not a public suffix

• A page can read the cookies for:
  ➤ its own domain
  ➤ any sub-domain

Yes, cseweb.ucsd.edu can set cookies for ucsd.edu (unless ucsd.edu is on public suffix list)
A "public suffix" is one under which Internet users can (or historically could) directly register names. Some examples of public suffixes are .com, .co.uk and pvt.k12.ma.us. The Public Suffix List is a list of all known public suffixes.

The Public Suffix List is an initiative of Mozilla, but is maintained as a community resource. It is available for use in any software, but was originally created to meet the needs of browser manufacturers. It allows browsers to, for example:

- Avoid privacy-damaging "supercookies" being set for high-level domain name suffixes
- Highlight the most important part of a domain name in the user interface
- Accurately sort history entries by site

We maintain a fuller (although not exhaustive) list of what people are using it for. If you are using it for something else, you are encouraged to tell us, because it helps us to assess the potential impact of changes. For that, you can use the psl-discuss mailing list, where we consider issues related to the maintenance, format and semantics of the list. Note: please do not use this mailing list to request amendments to the PSL's data.

It is in the interest of Internet registries to see that their section of the list is up to date. If it is not, their customers may have trouble setting cookies, or data about their sites may display sub-optimally. So we encourage them to maintain their section of the list by submitting amendments.

When does the browser send which cookies?

- Browsers used to send all cookies in a URL’s scope:
  - Cookie’s domain is domain suffix of URL’s domain
  - Cookie’s path is a prefix of the URL path

- New browsers only do this when SameSite=None
  - We’ll see SameSite in a bit
When does the browser send which cookies?

<table>
<thead>
<tr>
<th>Request to URL</th>
<th>Do we send the cookie?</th>
</tr>
</thead>
<tbody>
<tr>
<td>checkout.site.com</td>
<td></td>
</tr>
<tr>
<td>login.site.com</td>
<td></td>
</tr>
<tr>
<td>login.site.com/my/home</td>
<td></td>
</tr>
<tr>
<td>site.com/my</td>
<td></td>
</tr>
</tbody>
</table>

Set-Cookie: ...;
Domain=login.site.com;
Path=/;

Set-Cookie: ...;
Domain=site.com;
Path=/;

Set-Cookie: ...;
Domain=site.com;
Path=/my/home;

Send cookie when

- Cookie’s domain is domain suffix of URL’s domain
- Cookie’s path is a prefix of the URL path
When does the browser send which cookies?

<table>
<thead>
<tr>
<th>Request to URL</th>
<th>Do we send the cookie?</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Set-Cookie: ...;</td>
</tr>
<tr>
<td></td>
<td>Domain=login.site.com;</td>
</tr>
<tr>
<td></td>
<td>Path=/;</td>
</tr>
<tr>
<td>checkout.site.com</td>
<td>No</td>
</tr>
<tr>
<td>login.site.com</td>
<td>Yes</td>
</tr>
<tr>
<td>login.site.com/my/home</td>
<td>Yes</td>
</tr>
<tr>
<td>site.com/my</td>
<td>No</td>
</tr>
</tbody>
</table>

Send cookie when

- Cookie’s domain is domain suffix of URL’s domain
- Cookie’s path is a prefix of the URL path
Does the cookie path give us finer-grained isolation than the SOP?
No!

- **Cookie SOP:**
  - cseweb.ucsd.edu/~dstefan does not see cookies for cseweb.ucsd.edu/~nadiah

- **DOM SOP:**
  - cseweb.ucsd.edu/~dstefan can access the DOM of cseweb.ucsd.edu/~nadiah
  - How can you access cookie?
    ```javascript
    const iframe = document.createElement("iframe");
    iframe.src = "https://cseweb.ucsd.edu/~nadiah";
    document.body.appendChild(iframe);
    alert(iframe.contentWindow.document.cookie);
    ```
What happens when your bank includes Google Analytics JavaScript? Can it access your bank’s authentication cookie?

➤ Yes! JavaScript runs with the origin’s privileges. Can access `document.cookie`.

And SOP doesn’t prevent leaking data:

```javascript
const img = document.createElement("image");
document.body.appendChild(img);
```
Use HttpOnly cookies

Set-Cookie: id=a3fWa; Expires=Wed, 21 Oct 2015 07:28:00 GMT; HttpOnly;

Don’t expose cookie to JavaScript via document.cookie
When does the browser send which cookies?

• Browsers used to send all cookies in a URL’s scope:
  ➤ Cookie’s domain is domain suffix of URL’s domain
  ➤ Cookie’s path is a prefix of the URL path

• New browsers only do this when SameSite=None
  ➤ We’ll see SameSite in a bit

Why???
Motivation for SameSite cookies
Which cookies are sent? (SameSite=None)

http://bank.ch
🍪
🍪
http://evil.com
https://evil.com
http://bank.ch
🍪
http://4chan.org
Which cookies are sent? *(SameSite=None)*

```html
<html>
  <img src="https://bank.ch">
</html>
```
Which cookies are sent? *(SameSite=None)*

```
<html>
    <img src="https://bank.ch">
</html>
```
Why is this bad?

<html>
  <img src="https://bank.ch/transfer?amt=$1B&to=evil"/>
</html>

Cross-site request forgery (CSRF) attack!
SameSite cookies

Set-Cookie: id=a3fWa; Expires=Wed, 21 Oct 2015 07:28:00 GMT; SameSite=(None|Lax|Strict);

➤ Strict: Only send cookie when the request originates from the same site (top-level domain)
➤ Lax: Send cookie on top-level “safe” navigations (even if navigating cross-site)
➤ None: send cookie without taking context into account
Which cookies are sent? *(SameSite=Lax)*

```html
<html>
  <img src="https://bank.ch">
</html>
```

None!
Which cookies are sent? (SameSite=Lax)

<html>
  <a href="https://bank.ch">click me!</a>
</html>

https://evil.com

http://evil.com
http://bank.ch
http://4chan.org

Finally: Secure cookies

A secure cookie is only sent to the server with an encrypted request over the HTTPS protocol.

Set-Cookie: id=a3fWa; Expires=Wed, 21 Oct 2015 07:28:00 GMT; Secure;
Why do we care about this?

- Network attacker can steal cookies if server allows unencrypted HTTP traffic

- Don’t need to wait for user to go to the site; web attacker can make cross-origin request
Lecture objectives

- Basic understanding of how the web works
- Understand relevant attacker models
- Understand browser same-origin policy
