Fundamentals and lambda calculus
Again: JavaScript functions

- JavaScript functions are first-class
  - Syntax is a bit ugly/terse when you want to use functions as values; recall block scoping:
    ```javascript
    (function () {
        // ... do something
    }) ();
    ```

- New version has cleaner syntax called “arrow functions”
  - Semantics not always the same (this has different meaning), but for this class should always be safe to use

In this lecture
What is the lambda calculus?

- Simplest reasonable programming language
  - Only has one feature: functions
Why study it?

• Captures the idea of first-class functions

  ➤ Good system for studying the concept of variable binding that appears in almost all languages

• Historically important

  ➤ Competing model of computation introduced by Church as an alternative to Turing machines: substitution (you’ll see this today) = symbolic comp

  ➤ Influenced Lisp (thus JS), ML, Haskell, C++, etc.
Why else?

• Base for studying many programming languages
  ➤ You can use lambda calculus and extended it in different ways to study languages and features
  ➤ E.g., we can study the difference between strict languages like JavaScript and lazy ones like Haskell
    ➤ \( \lambda \) + evaluation strategy
  ➤ E.g., we can study different kinds of type systems
    ➤ Simply-typed \( \lambda \) calculus, polymorphic, etc.
Most PL papers describe language models that build on lambda calculus.

- Understanding $\lambda$ will help you interpret what you are reading in PL research papers.
- Understanding $\lambda$ will help you get started with other formal/theoretical foundations:
  - Operational semantics
  - Denotational semantics
Before we get started, some terminology

• Syntax (grammar)
  ➤ The symbols used to write a program
  ➤ E.g., \((x + y)\) is a grammatical expression

• Semantics
  ➤ The actions that occur when a program is executed

• PL implementation: Syntax \(\rightarrow\) Semantics
Before we get started, some terminology

• Syntax (grammar)
  ➤ The symbols used to write a program
  ➤ E.g., \((x + y)\) is a grammatical expression

• Semantics

• PL implementation: Syntax -> Semantics
Before we get started, some terminology

• Syntax (grammar)
  ➤ The symbols used to write a program
  ➤ E.g., \((x + y)\) is a grammatical expression

• Semantics
  ➤ The actions that occur when a program is executed

• PL implementation: Syntax -> Semantics
Week 2

• Syntax of $\lambda$ calculus

• Semantics of $\lambda$ calculus
  ➢ Informal substitution
  ➢ Free and bound variables
  ➢ Formal substitution
  ➢ Evaluation order
Lambda calculus

• Language syntax (grammar):
  ➤ Expressions: \( e ::= x \mid \lambda x.e \mid e_1 e_2 \)
  ➤ Variables: \( x \)
  ➤ Functions or \( \lambda \) abstractions: \( \lambda x.e \)
    ➤ This is the same as \( x \Rightarrow e \) in JavaScript!
  ➤ Function application: \( e_1 e_2 \)
    ➤ This is the same as \( e_1 (e_2) \) in JavaScript!
Example terms

- $\lambda x.(2 + x)$
  - Same as: $x \Rightarrow (2 + x)$

- $(\lambda x.(2 + x)) \ 5$
  - Same as: $(x \Rightarrow (2 + x))(5)$

- $(\lambda f.(f \ 3)) \ (\lambda x.(x + 1))$
  - Same as: $(f \Rightarrow (f \ (3)))(x \Rightarrow (x + 1))$
Example terms

- \( \lambda x. (2 + x) \)
  - LIES! What is this “2” and “+”? (Sugar.)
  - Same as: \( x \mapsto (2 + x) \)

- \( (\lambda x. (2 + x)) \, 5 \)
  - Same as: \( (x \mapsto (2 + x)) \, (5) \)

- \( (\lambda f. (f \, 3)) \, (\lambda x. (x + 1)) \)
  - Same as: \( (f \mapsto (f \, (3))) \, (x \mapsto (x+1)) \)
Example terms

- $\lambda x.(2+x)$
  - Same as: $x \Rightarrow (2 + x)$

- $(\lambda x.(2 + x)) \ 5$
  - Same as: $(x \Rightarrow (2 + x)) \ (5)$

- $(\lambda f.(f \ 3)) \ (\lambda x.(x + 1))$
  - Same as: $(f \Rightarrow (f \ (3))) \ (x \Rightarrow (x+1))$
Example terms

- $\lambda x.(2+x)$
  - Same as: $x \to (2 + x)$

- $(\lambda x.(2 + x)) \; 5$
  - Same as: $(x \to (2 + x)) \; (5)$

- $(\lambda f.(f \; 3)) \; (\lambda x.(x + 1))$
  - Same as: $(f \to (f \; (3))) \; (x \to (x+1))$
Example terms

- $\lambda x.(2+x)$
  - Same as: $x \Rightarrow (2 + x)$

- $(\lambda x.(2 + x)) 5$
  - Same as: $(x \Rightarrow (2 + x))(5)$

- $(\lambda f.(f 3)) (\lambda x.(x + 1))$
  - Same as: $(f \Rightarrow (f (3))) (x \Rightarrow (x+1))$
JavaScript to $\lambda$ calculus

• Let’s look at function composition: $(f \circ f)(x)$

• In JavaScript:
  ➤ $f \Rightarrow (x \Rightarrow f(f(x)))$
  ➤ $((f \Rightarrow (x \Rightarrow f(f(x)))))(x \Rightarrow x+1))(4)$

• In $\lambda$:
JavaScript to $\lambda$ calculus

• Let’s look at function composition: $(f \circ f)(x)$

• In JavaScript:
  
  ➤ $\text{f => (x => f (f (x)))}$

  ➤ $((\text{f => (x => f (f (x))))}) (x => x+1)) (4)$

• In $\lambda$:
  
  ➤ $\lambda f.(\lambda x. f (f x))$
JavaScript to $\lambda$ calculus

• Let’s look at function composition: $(f \circ f)(x)$

• In JavaScript:
  ➤ $f \Rightarrow (x \Rightarrow f(f(x)))$
  ➤ $((f \Rightarrow (x \Rightarrow f(f(x))))(x \Rightarrow x+1))(4)$

• In $\lambda$:
  ➤ $\lambda f.(\lambda x. f(f(x)))$
  ➤ $((\lambda f.(\lambda x. f(f(x)))(\lambda x.x+1))4$
Understanding $\lambda$ calculus syntax

- $\lambda$-calculus syntax: $e ::= x \mid \lambda x.e \mid e_1 e_2$

  ➤ Is $\lambda(x+y).3$ a valid term? (A: yes, B: no)

  ➤ Is $\lambda x.3$ a valid term? (A: yes, B: no)

  ➤ Is $\lambda x. (x \; x)$ a valid term? (A: yes, B: no)

  ➤ Is $\lambda x. x \; (x \; y)$ a valid term? (A: yes, B: no)
Understanding $\lambda$ calculus syntax

- $\lambda$-calculus syntax: $e ::= x \mid \lambda x. e \mid e_1 e_2$

- Is $\lambda(x+y). 3$ a valid term? (A: yes, B: no)
- Is $\lambda x. 3$ a valid term? (A: yes, B: no)
- Is $\lambda x. (x \ x)$ a valid term? (A: yes, B: no)
- Is $\lambda x. x \ (x \ y)$ a valid term? (A: yes, B: no)
Understanding $\lambda$ calculus syntax

- $\lambda$-calculus syntax: $e ::= x \mid \lambda x.e \mid e_1 e_2$

➤ Is $\lambda(x+y).3$ a valid term? (A: yes, B: no)

➤ Is $\lambda x.3$ a valid term? (A: yes, B: no)

➤ Is $\lambda x.(x \ x)$ a valid term? (A: yes, B: no)

➤ Is $\lambda x. x \ (x \ y)$ a valid term? (A: yes, B: no)
Understanding $\lambda$ calculus syntax

- $\lambda$-calculus syntax: $e ::= x \mid \lambda x. e \mid e_1 e_2$

- Is $\lambda(x+y). 3$ a valid term? (A: yes, B: no)

- Is $\lambda x. 3$ a valid term? (A: yes, B: no)

- Is $\lambda x. (x \cdot x)$ a valid term? (A: yes, B: no)

- Is $\lambda x. x (x \cdot y)$ a valid term? (A: yes, B: no)
Understanding $\lambda$ calculus syntax

- $\lambda$-calculus syntax: $e ::= x | \lambda x. e | e_1 e_2$

- Is $\lambda(x+y). 3$ a valid term? (A: yes, B: no)
- Is $\lambda x. 3$ a valid term? (A: yes, B: no)
- Is $\lambda x. (x \times x)$ a valid term? (A: yes, B: no)
- Is $\lambda x. x (x y)$ a valid term? (A: yes, B: no)
More compact syntax

• Function application is left associative

\[ e_1 \ e_2 \ e_3 \equiv (e_1 \ e_2) \ e_3 \]

• Lambdas binds all the way to right: only stop when you find unmatched closing paren ‘)’

\[ \lambda x.\lambda y.\lambda z.e \equiv \lambda x.(\lambda y.(\lambda z.e)) \]

• Why? Lambda abstraction has lowest precedence!
Understanding compact syntax

- Write the parens: \( \lambda x.x \times \)
  - A: \( \lambda x.(x \times) \)
  - B: \((\lambda x.x) \times\)
Understanding compact syntax

• Write the parens: $\lambda x.x$ $x$

  ➤ A: $\lambda x.(x x)$

  ➤ B: $(\lambda x.x) x$
Understanding compact syntax

• Write the parens: $\lambda y.\lambda x.x \ x =$
  ➤ A: $\lambda y. (\lambda x. x) \ x$
  ➤ B: $\lambda y. (\lambda x. (x \ x))$
  ➤ C: $(\lambda y. (\lambda x. x)) \ x$
Understanding compact syntax

- Write the parens: \( \lambda y. \lambda x. x \ x = \)
  - A: \( \lambda y. (\lambda x. x) \ x \)
  - B: \( \lambda y. (\lambda x. (x \ x)) \)
  - C: \( (\lambda y. (\lambda x. x)) \ x \)
Understanding compact syntax

- Is \((\lambda y.\lambda x.x)\) \(x = \lambda y.\lambda x.x \ x\) ?
  - A: yes
  - B: no
Understanding compact syntax

- Is \((\lambda y.\lambda x.x)\) \(x = \lambda y.\lambda x.x x\)?
  - A: yes
  - B: no
Parsing rules

- Applications are left associative
- Precedence: application > lambda abstraction
Add parentheses

- $\lambda y.\lambda x.x \times \lambda z.y \lambda w.w$
- $\lambda y.\lambda x.(x \times) \lambda z.y \lambda w.w$
- $\lambda y.\lambda x.((x \times) \lambda z.y) \lambda w.w$
- $\lambda y.\lambda x.(((x \times) \lambda z.y) \lambda w.w)$
- $\lambda y.\lambda x.(((x \times) \lambda z.y) (\lambda w.w))$

- $A: \lambda y.\lambda x.(((x \times) (\lambda z.y)) (\lambda w.w))$
- $B: \lambda y.\lambda x.(((x \times) (\lambda z.y) (\lambda w.w)))$
Add parentheses

- $\lambda y. \lambda x. x \times \lambda z. y \lambda w. w$
- $\lambda y. \lambda x. (x \times) \lambda z. y \lambda w. w$
- $\lambda y. \lambda x. ((x \times) \lambda z. y) \lambda w. w$
- $\lambda y. \lambda x. (((x \times) \lambda z. y) \lambda w. w)$
- $\lambda y. \lambda x. (((x \times) \lambda z. y) (\lambda w. w))$
- **A: $\lambda y. \lambda x. (((x \times) (\lambda z. y)) (\lambda w. w))$**
- **B: $\lambda y. \lambda x. (((x \times) (\lambda z. y) (\lambda w. w)))$**
Add parentheses

- $\lambda y. \lambda x. x x \lambda z. y \lambda w. w$
- $\lambda y. \lambda x. (x x) \lambda z. y \lambda w. w$
- $\lambda y. \lambda x. ((x x) \lambda z. y) \lambda w. w$
- $\lambda y. \lambda x. (((x x) \lambda z. y) \lambda w. w)$
- $\lambda y. \lambda x. (((x x) \lambda z. y) (\lambda w. w))$

- **A:** $\lambda y. \lambda x. (((x x) (\lambda z. y)) (\lambda w. w))$

  First unmatched closing paren

- **B:** $\lambda y. \lambda x. (((x x) (\lambda z. y) (\lambda w. w)))$
Even more compact syntax

• Can always variables left of the period
  ➤ $\lambda x.\lambda y.\lambda z.e \equiv \lambda xyz.e$

• This makes the term look like a 3 argument function
  ➤ Can implement multiple-argument function using single-argument functions: called currying (bonus)

• We won’t use this syntax, but you may see in the wild
Week 2

• Syntax of $\lambda$ calculus ✓

• Semantics of $\lambda$ calculus
  ➤ Informal substitution
  ➤ Free and bound variables
  ➤ Formal substitution
  ➤ Evaluation order
Semantics of $\lambda$ calculus

• Reduce a term to another as much as we can
  ➤ If we can’t reduce it any further, the term is said to be in normal form

• How? Rewrite terms!
  ➤ What does that mean?! Substitution!
Example terms

- Example: \((\lambda x. (2 + x))(5)\)
  
  ➤ In JavaScript: \((x \mapsto (2 + x))(5)\)

- Example: \((\lambda f. (f \ 3)) \ (\lambda x. (x + 1))\)
  
  ➤ In JavaScript: \((f \mapsto (f \ 3))(x \mapsto (x+1))\)
Example terms

• Example: \((\lambda x.(2 + x)) \ 5\)

  ➤ In JavaScript: \((x => (2 + x)) \ (5) \rightarrow (2 + 5)\)

• Example: \((\lambda f.(f \ 3)) \ (\lambda x.(x + 1))\)

  ➤ In JavaScript: \((f => (f \ (3))) \ (x => (x+1))\)
Example terms

• Example: \((\lambda x.(2 + x))\) 5

  ➤ In JavaScript: \((x \mapsto (2 + x))(5) \rightarrow (2 + 5) \rightarrow 7\)

• Example: \((\lambda f.(f \, 3))\) \((\lambda x.(x + 1))\)

  ➤ In JavaScript: \((f \mapsto (f \, (3)))(x \mapsto (x+1))\)
Example terms

• Example: $(\lambda x.(2 + x)) \ 5 \rightarrow (2 + 5)$

  ➤ In JavaScript: $(x \Rightarrow (2 + x))(5) \rightarrow (2 + 5) \rightarrow 7$

• Example: $(\lambda f.(f \ 3))(\lambda x.(x + 1))$

  ➤ In JavaScript: $(f \Rightarrow (f \ (3)))(x \Rightarrow (x+1))$
Example terms

• Example: $(\lambda x.(2 + x)) \ 5 \rightarrow (2 + 5) \rightarrow 7$

  ➤ In JavaScript: $(x \Rightarrow (2 + x)) \ (5) \rightarrow (2 + 5) \rightarrow 7$

• Example: $(\lambda f.(f \ 3)) \ (\lambda x.(x + 1))$

  ➤ In JavaScript: $(f \Rightarrow (f \ (3))) \ (x \Rightarrow (x+1))$
Example terms

• Example: \((\lambda x.(2 + x)) \ 5 \to (2 + 5) \to 7\)

  ➤ In JavaScript: \((x => (2 + x))\) \((5) \to (2 + 5) \to 7\)

• Example: \((\lambda f.(f\ 3)) \ (\lambda x.(x + 1))\)

  ➤ In JavaScript: \((f => (f\ (3)))\) \((x => (x+1))\)

  \[\to (((x => (x+1))\ (3))\]
Example terms

• Example: \((\lambda x.(2 + x)) \, 5 \rightarrow (2 + 5) \rightarrow 7\)

  ➤ In JavaScript: \((x \Rightarrow (2 + x)) \, (5) \rightarrow (2 + 5) \rightarrow 7\)

• Example: \((\lambda f.(f \, 3)) \, (\lambda x.(x + 1))\)

  ➤ In JavaScript: \((f \Rightarrow (f \,(3))) \, (x \Rightarrow (x+1))\)

    \(\rightarrow ((x \Rightarrow (x+1)) \, (3))\)

    \(\rightarrow (3+1) \rightarrow 4\)
Example terms

• Example: \((\lambda x.(2 + x)) \, 5 \rightarrow (2 + 5) \rightarrow 7\)

➤ In JavaScript: \((x => (2 + x)) \, (5) \rightarrow (2 + 5) \rightarrow 7\)

• Example: \((\lambda f.(f \, 3)) \, (\lambda x.(x + 1))\)  
  \[\rightarrow ((\lambda x.(x + 1)) \, 3)\]

➤ In JavaScript: \((f => (f \, (3))) \, (x => (x+1))\)  
  \[\rightarrow (((x => (x+1)) \, 3)\)  
  \[\rightarrow (3+1) \rightarrow 4\]
Example terms

• Example: $(\lambda x.(2 + x)) \; 5 \rightarrow (2 + 5) \rightarrow 7$
  
  ➤ In JavaScript: $(x \Rightarrow (2 + x)) \; (5) \rightarrow (2 + 5) \rightarrow 7$

• Example: $(\lambda f.(f \; 3)) \; (\lambda x.(x + 1))$
  
  \[ \rightarrow ((\lambda x.(x + 1)) \; 3) \]
  
  \[ \rightarrow (3 + 1) \rightarrow 4 \]
  
  ➤ In JavaScript: $(f \Rightarrow (f \; (3))) \; (x \Rightarrow (x+1))$
  
  \[ \rightarrow (((x \Rightarrow (x+1)) \; 3) \]
  
  \[ \rightarrow (3+1) \rightarrow 4 \]
Easy! Pattern for function application: substitute the term you are applying the function to for the argument variable.
Substitution (not right)

- **Def:** Substitution: $e_1 [x := e_2]$
  
  - Replace every occurrence of $x$ in $e_1$ with $e_2$

- **General reduction rule for $\lambda$ calculus:**
  
  - $(\lambda x. e_1) e_2 \rightarrow$

  - Function application rewritten to $e_1$ (the function body) with every $x$ in $e_1$ substituted with $e_2$ (argument)
Substitution (not right)

• **Def:** Substitution: $e_1 [x := e_2]$

  ➤ Replace every occurrence of $x$ in $e_1$ with $e_2$

• General reduction rule for $\lambda$ calculus:

  ➤ $(\lambda x.e_1) e_2 \rightarrow e_1 [x := e_2]$

  ➤ Function application rewritten to $e_1$ (the function body) with every $x$ in $e_1$ substituted with $e_2$ (argument)
Simple examples

• Reduce $(\lambda x.(2 + x)) \ 5$

• Reduce: $(\lambda x.\lambda y.\lambda z.y+3) \ 4 \ 5 \ 6 =$
Simple examples

• Reduce \((\lambda x. (2 + x))\) 5 \(\rightarrow\) \((2 + 5)\) \(\rightarrow\) 7

• Reduce: \((\lambda x. \lambda y. \lambda z. y + 3)\) 4 5 6 =
Simple examples

• Reduce \((\lambda x. (2 + x))\) 5 \(\rightarrow\) \((2 + 5)\) \(\rightarrow\) 7

• Reduce: \((\lambda x. \lambda y. \lambda z. y + 3)\) 4 5 6 =

\[(((\lambda x. \lambda y. \lambda z. y + 3)\) 4) 5) 6 \rightarrow\]
\[((\lambda y. \lambda z. y + 3)\) 5) 6 \rightarrow\]
\((\lambda z. 5 + 3)\) 6 \rightarrow \((5 + 3)\) \(\rightarrow\) 8
Simple examples (cont)

- Reduce \( (\lambda x. (\lambda y. 2) \ 3) \ 5 \)
- Reduce: \( ((\lambda x. (\lambda y. 2)) \ 3) \ 5 \)
- Is \( (\lambda x. (\lambda y. 2) \ 3) \ 5 = ((\lambda x. (\lambda y. 2)) \ 3) \ 5 \) ?
  
  ➤ A: yes, B: no
Simple examples (cont)

• Reduce \((\lambda x. (\lambda y. 2) \ 3) \ 5 \rightarrow (\lambda x. \ 2) \ 5 \rightarrow 2\)

• Reduce: \(((\lambda x. (\lambda y. 2)) \ 3) \ 5\)

• Is \((\lambda x. (\lambda y. 2) \ 3) \ 5 = ((\lambda x. (\lambda y. 2)) \ 3) \ 5\)?
  
  ➤ A: yes, B: no
Simple examples (cont)

• Reduce $(\lambda x.(\lambda y.2) 3) \ 5 \rightarrow (\lambda x.2) \ 5 \rightarrow 2$

• Reduce: $((\lambda x.(\lambda y.2)) \ 3) \ 5 \rightarrow ((\lambda y.2) \ 5) \rightarrow 2$

• Is $(\lambda x.(\lambda y.2) \ 3) \ 5 = ((\lambda x.(\lambda y.2)) \ 3) \ 5$?
  ➤ A: yes, B: no
Simple examples (cont)

• Reduce \((\lambda x. (\lambda y. 2)\ 3)\ 5\) \(\rightarrow\) \((\lambda x. 2)\ 5\) \(\rightarrow\) 2

• Reduce: \(((\lambda x. (\lambda y. 2))\ 3)\ 5\) \(\rightarrow\) \(((\lambda y. 2)\ 5)\) \(\rightarrow\) 2

• Is \((\lambda x. (\lambda y. 2)\ 3)\ 5\) = \(((\lambda x. (\lambda y. 2))\ 3)\ 5\) ?

  ➤ A: yes, B: no
A more complicated example
A more complicated example

- Reduce the following:

  \((\lambda x. (\lambda a. x + a) \ 7) \ 4\)
A more complicated example

• Reduce the following:
  ➤ \((\lambda x. (\lambda a. x + a) \ 7) \ 4\)
  ➤ \((\lambda a. 4 + a) \ 7\)
A more complicated example

- Reduce the following:

- $(\lambda x. (\lambda a. x + a) \ 7) \ 4$
- $(\lambda a. 4 + a) \ 7$
- $4 + 7$
A more complicated example

• Reduce the following:
  ➤ \((\lambda x. (\lambda a. x + a) 7) 4\)
  ➤ \((\lambda a. 4 + a) 7\)
  ➤ \(4 + 7\)
  ➤ \(11\)
Let’s make this even more fun!
Let’s make this even more fun!

- Instead of 4, let’s apply function to \((a + 5)\)

\[
(\lambda x. (\lambda a. x + a)\ 7)\ (a + 5)
\]
Let’s make this even more fun!

• Instead of 4, let’s apply function to \((a + 5)\)

\[
\begin{align*}
\text{➔ } & (\lambda x. (\lambda a. x + a) \ 7) \ (a + 5) \\
\text{➔ } & (\lambda a. (a + 5) + a) \ 7
\end{align*}
\]
Let’s make this even more fun!

• Instead of 4, let’s apply function to $(a + 5)$

  ➤ $(\lambda x. (\lambda a. x + a) \ 7) \ (a + 5)$

  ➤ $(\lambda a. (a + 5) + a) \ 7$

  ➤ $(7 + 5) + 7$
Let’s make this even more fun!

• Instead of 4, let’s apply function to \((a + 5)\)

  ➤ \((\lambda x. (\lambda a. x + a)\ 7)\ (a + 5)\)

  ➤ \((\lambda a. (a + 5) + a)\ 7\)

  ➤ \((7 + 5) + 7\)

  ➤ 19
Let’s make this even more fun!

- Instead of 4, let’s apply function to (a + 5)

  ➤ (λx. (λa. x + a) 7) (a + 5)

  ➤ (λa. (a + 5) + a) 7

  ➤ (7 + 5) + 7

  ➤ 19

Is this right? A: yes, B: no
Let’s make this even more fun!

- Instead of 4, let’s apply function to \((a + 5)\)

\[
(\lambda x. (\lambda a. x + a) \, 7) \, (a + 5)
\]

\[
(\lambda a. (a + 5) + a) \, 7
\]

\[
(7 + 5) + 7
\]

\[
19
\]

Is this right? 
A: yes, B: no
Substitution is surprisingly complex

- Recall our reduction rule for application:
  
  $$\left(\lambda x. e_1\right) e_2 \rightarrow e_1 \left[ x := e_2 \right]$$

- This function application reduces to $e_1$ (the function body) where every $x$ in $e_1$ is substituted with $e_2$ (value we’re applying func to)

- Where did we go wrong? When we substituted:

  $$\left(\lambda x. \left(\lambda a. x + a\right) 7\right) (a + 5)$$

  $$\left(\lambda a. (a + 5) + a\right) 7$$ the $a$ is **captured**!
Example to do at home
Example to do at home

• Reduce the following

\[ (\lambda f. (\lambda x. f (f x))) (\lambda x. x+1)) 4 \]
Example to do at home

• Reduce the following

> \(((\lambda f. (\lambda x. f (f x))) \ (\lambda x. x+1)) \ 4\)

> \((\lambda x. (\lambda x. x+1) \ ((\lambda x. x+1) \ x)) \ 4\)
Example to do at home

• Reduce the following

➤ \( ((\lambda f. (\lambda x. f (f x))) (\lambda x. x+1)) 4 \)

➤ \( (\lambda x. (\lambda x. x+1) ((\lambda x. x+1) \ x)) 4 \)

➤ \( (\lambda x. x+1) ((\lambda x. x+1) \ 4) \)
Example to do at home

• Reduce the following

\[ ((\lambda f. (\lambda x. f (f x))) \ (\lambda x. x+1)) \ 4 \]

\[ (\lambda x. (\lambda x. x+1) \ ((\lambda x. x+1) \ x)) \ 4 \]

\[ (\lambda x. x+1) \ ((\lambda x. x+1) \ 4) \]

\[ (\lambda x. x+1) \ (4+1) \]
Example to do at home

- Reduce the following

\[
\begin{align*}
& ((\lambda f. (\lambda x. f (f x))) \ (\lambda x. x+1)) \ 4 \\
& (\lambda x. (\lambda x. x+1) \ ((\lambda x. x+1) \ x)) \ 4 \\
& (\lambda x. x+1) \ ((\lambda x. x+1) \ 4) \\
& (\lambda x. x+1) \ (4+1) \\
& 4+1+1
\end{align*}
\]
Example to do at home

• Reduce the following

  ➤ \(((\lambda f.(\lambda x. f (f x))) \ (\lambda x.x+1)) \ 4\)

  ➤ \( (\lambda x. (\lambda x.x+1) \ ((\lambda x.x+1) \ x)) \ 4\)

  ➤ \( (\lambda x.x+1) \ ((\lambda x.x+1) \ 4)\)

  ➤ \( (\lambda x.x+1) \ (4+1)\)

  ➤ \( 4+1+1\)

  ➤ \( 6\)
Example to do at home
Example to do at home

• Reduce the following

➤ \((\lambda f.(\lambda x. f (f x))) (\lambda y.y+x)\)
Example to do at home

• Reduce the following

➤ \((\lambda f. (\lambda x. f (f x))) (\lambda y. y+x)\)

➤ \(\lambda x. (\lambda y. y+x) ((\lambda y. y+x) x)\)
Example to do at home

- Reduce the following

  ➤ $\lambda f. (\lambda x. f (f x)) (\lambda y. y+x)$

  ➤ $\lambda x. (\lambda y. y+x) ((\lambda y. y+x) x)$

  ➤ $\lambda x. (\lambda y. y+x) (x+x)$
Example to do at home

• Reduce the following

\[ (\lambda f. (\lambda x. f (f x))) (\lambda y. y+x) \]

\[ \lambda x. (\lambda y. y+x) ((\lambda y. y+x) x) \]

\[ \lambda x. (\lambda y. y+x) (x+x) \]

\[ \lambda x. (x+x+x) \]
Example to do at home

• Reduce the following

  ➤ \((\lambda f. (\lambda x. f (f x))) (\lambda y. y+x)\)

  ➤ \(\lambda x. (\lambda y. y+x) ((\lambda y. y+x) x)\)

  ➤ \(\lambda x. (\lambda y. y+x) (x+x)\)

  ➤ \(\lambda x. (x+x+x)\)

  that’s not a function that adds
  x to argument two times
Another way to see the problem

- Syntactic sugar: $\text{let } x = e_1 \text{ in } e_2 \overset{\text{def}}{=} (\lambda x. e_2) \; e_1$

- Let syntax makes this easy to see:

  - $\text{let } x = a + 5 \text{ in } \text{let } a = 7 \text{ in } x + a$
  - $\rightarrow$ $\text{let } a = 7 \text{ in } (a + 5) + a$

  - Very obviously wrong!

  - But, guess what: your C macro preprocessor does this!
Another way to see the problem

- Syntactic sugar: let \( x = e_1 \) in \( e_2 \) \( \overset{\text{def}}{=} (\lambda x.e_2) \) \( e_1 \)

- Let syntax makes this easy to see:

\[
\begin{align*}
\text{let } x &= a + 5 \text{ in } \quad \text{let } x &= a + 5 \text{ in} \\
\text{let } a &= 7 \text{ in} & \rightarrow & \text{let } a &= 7 \text{ in} \\
\quad x + a & \\ (a + 5) + a
\end{align*}
\]

- Very obviously wrong!

- But, guess what: your C macro preprocessor does this!
Fixing the problem

• How can we fix this?

  1. Rename variables!

     ➤ let x = a+5 in
        let a = 7 in
        x + a

  2. Do the “dumb” substitution!
Fixing the problem

• How can we fix this?

1. Rename variables!

   - let x = a+5 in         let x = a+5 in
     let a = 7 in          →  let a123 = 7 in
     x + a                        x + a123

2. Do the “dumb” substitution!
Fixing the problem

How can we fix this?

1. Rename variables!

   ➤ let x = a+5 in               let x = a+5 in               let x = a+5 in
      let a = 7 in                 ➤ let a123 = 7 in            ➤ let a123 = 7 in
      x + a                      ➤ x + a123                    (a+5) + a123

2. Do the “dumb” substitution!
Why is this the way to go?

• **Def:** variable $x$ is bound in $\lambda x.(x+y)$

  ➤ Can we always rename bound variables? A: yes, B:no

• Yes! Bound variables are just “placeholders”

  ➤ Above: $x$ is not special, we could have used $z$

  ➤ We say they are equivalent: $\lambda x.(x+y) =_\alpha \lambda z.(z+y)$

• Renaming amounts to converting bound variable names to avoid capture: e.g., $\lambda x.(x+y)$ to $\lambda z.(z+y)$
Can we rename everything?

- Can we rename y in $\lambda x.(x+y)$? (A: yes, B: no)

- Intuition:
Can we rename everything?

- Can we rename \( y \) in \( \lambda x.(x+y) \)? (A: yes, B: no)

  - No! We don’t know what \( y \) may be, so we must keep it as is!

- Intuition:

  -

  -

  -
Can we rename everything?

- Can we rename $y$ in $\lambda x. (x+y)$? (A: yes, B: no)
  - No! We don’t know what $y$ may be, so we must keep it as is!

- Intuition:
  - Can change the name of your function argument variables but not of variables from the outer scope
    - E.g., $\forall x. P(x, y)$ or $\sum_{i\in\{1,\ldots,10\}} x_i + y$
Week 2

• Syntax of λ calculus ✓

• Semantics of λ calculus
  ➤ Informal substitution ✓
  ➤ Free and bound variables
  ➤ Formal substitution
  ➤ Evaluation order
Let’s think about this more formally.
Def: free variables

• If a variable is not bound by a \( \lambda \), we say that it is free
  ➤ e.g., \( y \) is free in \( \lambda x.(x+y) \)
  ➤ is \( x \) free? A: yes, B: no

• We can compute the free variables of any term:
  ➤ \( \text{FV}(x) = \{x\} \)
  ➤ \( \text{FV}(\lambda x.e) = \text{FV}(e) \setminus \{x\} \)
  ➤ \( \text{FV}(e_1 e_2) = \text{FV}(e_1) \cup \text{FV}(e_2) \)
Def: free variables

• If a variable is not bound by a $\lambda$, we say that it is free

➤ e.g., $y$ is free in $\lambda x.(x+y)$

➤ is $x$ free? A: yes, B: no

• We can compute the free variables of any term:

➤ $FV(x) = \{x\}$

➤ $FV(\lambda x. e) = FV(e) \setminus \{x\}$

➤ $FV(e_1 e_2) = FV(e_1) \cup FV(e_2)$

think: build out!
Def: free variables

• If a variable is not bound by a λ, we say that it is free
  ➤ e.g., y is free in λx.(x+y)
  ➤ is x free? A: yes, B: no

• We can compute the free variables of any term:
  ➤ FV(x) = \{x\}
  ➤ FV(λx.e) = FV(e) \{x\}
  ➤ FV(e₁ e₂) = FV(e₁) \cup FV(e₂)

think: build out!
Def: free variables

• If a variable is not bound by a $\lambda$, we say that it is free

  ➤ e.g., $y$ is free in $\lambda x.(x+y)$

  ➤ is $x$ free? No! We say $x$ is bound in $\lambda x.(x+y)$

• We can compute the free variables of any term:

  ➤ $FV(x) = \{x\}$

  ➤ $FV(\lambda x.e) = FV(e) \setminus \{x\}$

  ➤ $FV(e_1 e_2) = FV(e_1) \cup FV(e_2)$

  think: build out!
Def: Capture-avoiding substitution

• Capture-avoiding substitution:
  ➤ $x[x:=e] = e$
  ➤ $y[x:=e] = y$ if $y \neq x$
  ➤ $(e_1 e_2)[x := e] = (e_1)[x := e](e_2)[x := e]$
  ➤ $(\lambda x.e_1)[x := e] = \lambda x.e_1$
  ➤ $(\lambda y.e_1)[x := e_2] =$
  ➤ $(\lambda y.e_1)[x := e_2]$ if $y \neq x$ and $y \notin \text{FV}(e_2)$

Why the if? If $y$ is free in $e_2$ this would capture it!
Def: Capture-avoiding substitution

- Capture-avoiding substitution:
  - $x[x:=e] = e$
  - $y[x:=e] = y$ if $y \neq x$
  - $(e_1 e_2)[x := e] = (e_1)[x := e] (e_2)[x := e]$
  - $(\lambda x.e_1)[x := e] = \lambda x.e_1$
  - $(\lambda y.e_1)[x := e_2] =$
Def: Capture-avoiding substitution

• Capture-avoiding substitution:
  
  ➤ $x[x:=e] = e$
  
  ➤ $y[x:=e] = y$ if $y \neq x$
  
  ➤ $(e_1 e_2)[x := e] =$
  
  ➤ $(\lambda x.e_1)[x := e] =$
  
  ➤ $(\lambda y.e_1)[x := e_2] =$

The Y combinator

Y Combinator created a new model for funding early stage startups.

Twice a year we invest a small amount of money ($120k) in a large number of startups.

The startups move to Silicon Valley for 3 months, during which we work intensively with them to get the company into the best possible shape and refine their pitch to investors. The cycle culminates in Demo Day, where the startups present their companies to a carefully selected, invite-only audience.

But YC doesn’t end on Demo Day. We and the YC alumni network continue to help founders for the life of their company, and beyond.
Y combinator

• Like \( \Omega \), there is a special term \( Y \) in lambda calculus

\[
Y \overset{\text{def}}{=} \lambda f. (\lambda x. f (x x)) (\lambda x. f (x x))
\]

• Why is this interesting? It reduces as follows

\[
\begin{align*}
Y f &= \beta f (Y f) \\
&= \beta f (f (Y f)) \\
&= \beta f (\ldots f (Y f) \ldots )
\end{align*}
\]
Y combinator

• Like Ω, there is a special term Y in lambda calculus

➤ Y ≝ λf. (λx. f (x x)) (λx. f (x x))

• Why is this interesting? It reduces as follows

➤ Y f

=β f (Y f)  

Def: Fixed-point of a function f is a value x such that f x = x

=β f (f (Y f))

=β f (… f (Y f) … )
How can we use this?

• Let’s go back to factorial example.

\[ f \triangleq \lambda \text{fac}. \lambda n. \text{if } n \leq 1 \text{ then } 1 \text{ else } n \times (\text{fac} \ (n-1)) \]

\[ \text{factorial} \triangleq Y \ f \]

\[ = \beta \ f \ (Y \ f) \]

\[ = f \ \text{factorial} \]

\[ = (\lambda \text{fac}. \lambda n. \text{if } n \leq 1 \text{ then } 1 \text{ else } n \times (\text{fac} \ (n-1))) \ \text{factorial} \]

\[ = \beta \ \lambda n. \text{if } n \leq 1 \text{ then } 1 \text{ else } n \times (\text{factorial} \ (n-1)) \]
How can we use this?

- Apply as usual:
  - \( \text{factorial} \ 2 \)
    \[ = \beta \ (f \ (Y \ f)) \ 2 \]
    \[ = \beta \ (\lambda n. \text{if } n \leq 1 \text{ then } 1 \text{ else } n * (\text{factorial} \ (n-1))) \ 2 \]
    \[ = \beta \ \text{if } 2 \leq 1 \text{ then } 1 \text{ else } 2 \ast (\text{factorial} \ (2-1)) \]
    \[ = \beta \ \text{if } 2 \leq 1 \text{ then } 1 \text{ else } 2 \ast (\text{factorial} \ 1) \]
    \[ = \beta \ 2 \ast (\text{factorial} \ 1) \]
How can we use this?

• Apply as usual:

\[=\beta\ 2 \times (\text{factorial} \ 1)\]

\[=\beta\ 2 \times ((f \ \text{factorial}) \ 1)\]

\[=\beta\ 2 \times ((\lambda n. \text{if } n \leq 1 \text{ then } 1 \text{ else } n \times (\text{factorial} \ (n-1))) \ 1)\]

\[=\beta\ 2 \times (\text{if } 1 \leq 1 \text{ then } 1 \text{ else } 1 \times (\text{factorial} \ (1-1)))\]

\[=\beta\ 2 \times (\text{if } 1 \leq 1 \text{ then } 1 \text{ else } 1 \times (\text{factorial} \ 0))\]

\[=\beta\ 2 \times 1\]

\[=\beta\ 2\]
